Universal Variable Speed AC Drive for induction and servo motors

Issue: 12

General Information

The manufacturer accepts no liability for any consequences resulting from inappropriate, negligent or incorrect installation or adjustment of the optional operating parameters of the equipment or from mismatching the variable speed drive with the motor.

The contents of this guide are believed to be correct at the time of printing. In the interests of a commitment to a policy of continuous development and improvement, the manufacturer reserves the right to change the specification of the product or its performance, or the contents of the guide, without notice.

All rights reserved. No parts of this guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by an information storage or retrieval system, without permission in writing from the publisher.

Drive software version

This product is supplied with the latest version of software. If this product is to be used in a new or existing system with other drives, there may be some differences between their software and the software in this product. These differences may cause this product to function differently. This may also apply to drives returned from a EPA Service Centre.

The software version of the drive can be checked by looking at Pr **11.29** (or Pr **0.50**) and Pr **11.34**. The software version takes the form of zz.yy.xx, where Pr **11.29** displays zz.yy and Pr **11.34** displays xx, i.e. for software version 01.01.00, Pr **11.29** would display 1.01 and Pr **11.34** would display 0.

If there is any doubt, contact a EPA Drive Centre.

Environmental statement

EPA is committed to minimising the environmental impacts of its manufacturing operations and of its products throughout their life cycle. To this end, we operate an Environmental Management System (EMS) which is certified to the International Standard ISO 14001. Further information on the EMS, our Environmental Policy and other relevant information is available on request.

The electronic variable-speed drives manufactured by EPA have the potential to save energy and (through increased machine/process efficiency) reduce raw material consumption and scrap throughout their long working lifetime. In typical applications, these positive environmental effects far outweigh the negative impacts of product manufacture and end-of-life disposal.

Nevertheless, when the products eventually reach the end of their useful life, they can very easily be dismantled into their major component parts for efficient recycling. Many parts snap together and can be separated without the use of tools, while other parts are secured with conventional screws. Virtually all parts of the product are suitable for recycling.

Product packaging is of good quality and can be re-used. Large products are packed in wooden crates, while smaller products come in strong cardboard cartons which themselves have a high recycled fibre content. If not re-used, these containers can be recycled. Polythene, used on the protective film and bags for wrapping product, can be recycled in the same way. EPA packaging strategy favours easily-recyclable materials of low environmental impact, and regular reviews identify opportunities for improvement.

When preparing to recycle or dispose of any product or packaging, please observe local legislation and best practice.

How to use this guide

This user guide provides complete information for installing and operating the drive from start to finish.

The information is in logical order, taking the reader from receiving the drive through to fine tuning the performance.

NOTE

There are specific safety warnings throughout this guide, located in the relevant sections. In addition, Chapter 1 *Safety Information* contains general safety information. It is essential that the warnings are observed and the information considered when working with or designing a system using the drive.

This map of the user guide helps to find the right sections for the task you wish to complete, but for specific information, refer to *Contents* on page 4:

SP0201	SP0202	SP0203	SP0204	SP0205
SP0401	SP0402	SP0403	SP0404	SP0405

The AC variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonised standards:

EN 61800-5-1	Adjustable speed electrical power drive systems - safety requirements - electrical, thermal and energy
EN 61800-3	Adjustable speed electrical power drive systems. EMC product standard including specific test methods
EN 61000-6-2	Electromagnetic compatibility (EMC). Generic standards. Immunity standard for industrial environments
EN 61000-6-4	Electromagnetic compatibility (EMC). Generic standards. Emission standard for industrial environments
EN 61000-3-2	Electromagnetic compatibility (EMC), Limits, Limits for harmonic current emissions (equipment input current <16A per phase)
EN 61000-3-3	Electromagnetic compatibility (EMC), Limits, Limitation of voltage fluctuations and flicker in low- voltage supply systems for equipment with rated current <16A

EN 61000-3-2: Applicable where input current <16A. No limits apply for professional equipment where input power >1kW.

These products comply with the Low Voltage Directive 2006/95/EC, the Electromagnetic Compatibility (EMC) Directive 2004/108/EC and the CE Marking Directive 93/68/EEC.

W. Drury Executive Vice President, Technology

Date: 8th August 2007

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters. The drives must be installed only by professional assemblers who are familiar with requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used. Refer to the User Guide. An EMC Data Sheet is also available giving detailed EMC information.

SP1201	SP1202	SP1203	SP1204
SP2201	SP2202	SP2203	
SP3201	SP3202		

SP1401	SP1402	SP1403	SP1404	SP1405	SP1406

SP3401	SP3402	SP3403				
SP3501	SP3502	SP3503	SP3504	SP3505	SP3506	SP3507

The AC variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonised standards:

EN 50178	Electronic equipment for use in power installations
EN 61800-3	Adjustable speed electrical power drive systems. EMC product standard including specific test methods
EN 61000-6-2	Electromagnetic compatibility (EMC). Generic standards. Immunity standard for industrial environments
EN 61000-6-4	Electromagnetic compatibility (EMC). Generic standards. Emission standard for industrial environments
EN 50081-2	Electromagnetic compatibility. Generic emission standard. Industrial environment
EN 50082-2	Electromagnetic compatibility. Generic immunity standard. Industrial environment
EN 61000-3-2 ¹	Electromagnetic compatibility (EMC). Limits. Limits for harmonic current emissions (equipment input current up to and including 16 A per phase)
EN 61000-3-3	Electromagnetic compatibility (EMC). Limits. Limitation of voltage fluctuations and flicker in low- voltage supply systems for equipment with rated current <= 16 A

¹ These products are for professional use, and power input exceeds 1kW for all models, so no limits apply.

These products comply with the Low Voltage Directive 73/23/EEC, the Electromagnetic Compatibility (EMC) Directive 89/336/EEC and the CE Marking Directive 93/68/EEC.

#### 1 Safety Information

#### 1.1 Warnings, Cautions and Notes

A Warning contains information which is essential for avoiding a safety hazard.

A Caution contains information which is necessary for avoiding a risk of damage to the product or other equipment.

#### NOTE

A Note contains information which helps to ensure correct operation of the product.

#### 1.2 Electrical safety - general warning

The voltages used in the drive can cause severe electrical shock and/or burns, and could be lethal. Extreme care is necessary at all times when working with or adjacent to the drive.

Specific warnings are given at the relevant places in this User Guide.

#### 1.3 System design and safety of personnel

The drive is intended as a component for professional incorporation into complete equipment or a system. If installed incorrectly, the drive may present a safety hazard.

The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control equipment which can cause injury.

Close attention is required to the electrical installation and the system design to avoid hazards either in normal operation or in the event of equipment malfunction. System design, installation, commissioning/ start-up and maintenance must be carried out by personnel who have the necessary training and experience. They must read this safety information and this User Guide carefully.

The STOP and SAFE TORQUE OFF (SECURE DISABLE) function functions of the drive do not isolate dangerous voltages from the output of the drive or from any external option unit. The supply must be disconnected by an approved electrical isolation device before gaining access to the electrical connections.

### With the sole exception of the SAFE TORQUE OFF (SECURE DISABLE) function, none of the drive functions must be used to ensure safety of personnel, i.e. they must not be used for safety-related functions.

Careful consideration must be given to the functions of the drive which might result in a hazard, either through their intended behaviour or through incorrect operation due to a fault. In any application where a malfunction of the drive or its control system could lead to or allow damage, loss or injury, a risk analysis must be carried out, and where necessary, further measures taken to reduce the risk - for example, an over-speed protection device in case of failure of the speed control, or a fail-safe mechanical brake in case of loss of motor braking.

The SAFE TORQUE OFF (SECURE DISABLE) function has been approved<sup>1</sup> as meeting the requirements of EN954-1 category 3 for the prevention of unexpected starting of the drive. It may be used in a safety-related application. The system designer is responsible for ensuring that the complete system is safe and designed correctly according to the relevant safety standards.

#### 1.4 Environmental limits

Instructions in this User Guide regarding transport, storage, installation and use of the drive must be complied with, including the specified environmental limits. Drives must not be subjected to excessive physical force.

#### 1.5 Compliance with regulations

The installer is responsible for complying with all relevant regulations, such as national wiring regulations, accident prevention regulations and electromagnetic compatibility (EMC) regulations. Particular attention must be given to the cross-sectional areas of conductors, the selection of fuses or other protection, and protective earth (ground) connections.

This User Guide contains instruction for achieving compliance with specific EMC standards.

Within the European Union, all machinery in which this product is used must comply with the following directives:

98/37/EC: Safety of machinery. 89/336/EEC: Electromagnetic Compatibility.

#### 1.6 Motor

Ensure the motor is installed in accordance with the manufacturer's recommendations. Ensure the motor shaft is not exposed.

Standard squirrel cage induction motors are designed for single speed operation. If it is intended to use the capability of the drive to run a motor at speeds above its designed maximum, it is strongly recommended that the manufacturer is consulted first.

Low speeds may cause the motor to overheat because the cooling fan becomes less effective. The motor should be installed with a protection thermistor. If necessary, an electric forced vent fan should be used.

The values of the motor parameters set in the drive affect the protection of the motor. The default values in the drive should not be relied upon.

It is essential that the correct value is entered in parameter **0.46** motor rated current. This affects the thermal protection of the motor.

#### 1.7 Adjusting parameters

Some parameters have a profound effect on the operation of the drive. They must not be altered without careful consideration of the impact on the controlled system. Measures must be taken to prevent unwanted changes due to error or tampering.

<sup>1</sup>Independent approval by BGIA has been given.

#### 2 Product Information

#### 2.1 Ratings

The Unidrive SP is dual rated.

The setting of the motor rated current determines which rating applies -Heavy Duty or Normal Duty.

The two ratings are compatible with motors designed to IEC60034. The graph aside illustrates the difference between Normal Duty and Heavy Duty with respect to continuous current rating and short term overload limits.

|                                                                                | le output<br>rent Overload limit -<br>Heavy Duty |                              |                                            |

|                                                                                | ue applications or applications                  |                              |                                            |

**Normal Duty** For applications which use Self ventilated (TENV/TEFC) induction motors and require a low overload capability, and full torque at low ability, or full torque is required at low speeds (e.g. winders, speeds is not required (e.g. fans, pumps). hoists). Self ventilated (TENV/TEFC) induction motors require increased The thermal protection is set to protect force ventilated induction motors protection against overload due to the reduced cooling effect of the fan and permanent magnet servo motors by default. at low speed. To provide the correct level of protection the I<sup>2</sup>t software NOTE operates at a level which is speed dependent. This is illustrated in the If the application uses a self ventilated (TENV/TEFC) induction motor graph below. and increased thermal protection is required for speeds below 50% base speed, then this can be enabled by setting Pr 4.25 = 1. NOTE The speed at which the low speed protection takes effect can be changed by the setting of Pr 4.25. The protection starts when the motor speed is below 15% of base speed when Pr 4.25 = 0 (default) and below 50% when Pr **4.25** = 1. Operation of motor  $l^2 t$  protection (It.AC trip) Motor I<sup>2</sup>t protection is fixed as shown below and is compatible with: Motor I<sup>2</sup>t protection defaults to be compatible with: Self ventilated (TENV/TEFC) induction motors Forced ventilation induction motors Permanent magnet servo motors Motor total current (Pr 4.01) Motor total current (Pr 4.01) as a percentage as a percentage of motor rated of motor rated I<sup>2</sup>t protection operates in this region I<sup>2</sup>t protection operates in this region current current 100% 100% 70% 70% Max. permissible Max. permissible continuous continuous current current Pr **4.25** = 0 Pr 4.25 = 0 --- Pr 4.25 = 1 ---- Pr 4.25 = 1 15% 50% 100% Motor speed as a Motor speed as a 50% 100% percentage of base speed percentage of base speed

The continuous current ratings given are for maximum  $40^{\circ}$ C ( $104^{\circ}$ F), 1000m altitude and 3.0 kHz switching. Derating is required for higher switching frequencies, ambient temperature > $40^{\circ}$ C ( $104^{\circ}$ F) and high altitude. For further information, refer to section 12.1.1 *Power and current ratings (Derating for switching frequency and temperature)* on page 258.

\*The closed loop peak current is based on 175% of the maximum continuous output current when the drive is used on a 3 phase supply. The value in brackets is the peak current based on 150% of the maximum continuous output current when the drive is used on a 1 phase supply.

#### 2.1.1 Typical short term overload limits

The maximum percentage overload limit changes depending on the selected motor. Variations in motor rated current, motor power factor and motor leakage inductance all result in changes in the maximum possible overload. The exact value for a specific motor can be calculated using the equations detailed in Menu 4 in the Advanced User Guide.

Typical values are shown in the table below for closed loop vector (VT) and open loop (OL) modes:

#### Table 2-5 Typical overload limits for size 0 to 5

| Operating mode                                                      | Closed loop from cold | Closed loop from 100% | Open loop from cold | Open loop from 100% |
|---------------------------------------------------------------------|-----------------------|-----------------------|---------------------|---------------------|
| Normal Duty overload with motor rated current = drive rated current | 110% for 165s         | 110% for 9s           | 110% for 165s       | 110% for 9s         |
| Heavy Duty overload with motor rated current = drive rated current  | 175% for 40s          | 175% for 5s           | 150% for 60s        | 150% for 8s         |
| Heavy Duty overload with a typical 4 pole motor                     | 200% for 28s          | 200% for 3s           | 175% for 40s        | 175% for 5s         |

#### Table 2-6 Typical overload limits for size 6

| Operating mode                                                      | Closed loop from cold | Closed loop from 100% | Open loop from cold | Open loop from 100% |
|---------------------------------------------------------------------|-----------------------|-----------------------|---------------------|---------------------|
| Normal Duty overload with motor rated current = drive rated current | 110% for 165s         | 110% for 9s           | 110% for 165s       | 110% for 9s         |
| Heavy Duty overload with motor rated current = drive rated current  | 150% for 60s          | 150% for 8s           | 129% for 97s        | 129% for 15s        |

Generally the drive rated current is higher than the matching motor rated current allowing a higher level of overload than the default setting as illustrated by the example of a typical 4 pole motor.

The time allowed in the overload region is proportionally reduced at very low output frequency on some drive ratings.

#### NOTE

The maximum overload level which can be attained is independent of the speed.

#### 2.2 Model number

The way in which the model numbers for the Unidrive SP range are formed is illustrated below.

#### 2.3 Operating modes

The Unidrive SP is designed to operate in any of the following modes:

- 1. Open loop mode
  - Open loop vector mode Fixed V/F mode (V/Hz)
  - Quadratic V/F mode (V/Hz)
- 2. RFC mode
- 3. Closed loop vector
- 4. Servo
- 5. Regen

#### 2.3.1 Open loop mode

The drive applies power to the motor at frequencies varied by the user. The motor speed is a result of the output frequency of the drive and slip due to the mechanical load. The drive can improve the speed control of the motor by applying slip compensation. The performance at low speed depends on whether V/F mode or open loop vector mode is selected.

For further details refer to section 8.1.1 *Open loop motor control* on page 130.

#### Open loop vector mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where the drive uses motor parameters to apply the correct voltage to keep the flux constant under varying load conditions.

Typically 100% torque is available down to 1Hz for a 50Hz motor.

#### Fixed V/F mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for multi-motor applications.

Typically 100% torque is available down to 4Hz for a 50Hz motor.

#### **Quadratic V/F mode**

The voltage applied to the motor is directly proportional to the square of the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for running fan or pump applications with quadratic load characteristics or for multi-motor applications. This mode is not suitable for applications requiring a high starting torque.

#### 2.3.2 RFC mode

Rotor flux control provides closed loop control without the need for position feedback by using current, voltages and key motor parameters to estimate the motor speed. It can eliminate instability traditionally associated with open loop control such as operating large motors with light loads at low frequencies.

For further details, refer to section 8.1.2 RFC mode on page 132.

#### 2.3.3 Closed loop vector mode

For use with induction motors with a feedback device installed.

The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed is exactly as demanded. Motor flux is accurately controlled at all times to provide full torque all the way down to zero speed.

#### 2.3.4 Servo

For use with permanent magnet brushless motors with a feedback device installed.

The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed is exactly as demanded. Flux control is not required because the motor is self excited by the permanent magnets which form part of the rotor.

Absolute position information is required from the feedback device to ensure the output voltage is accurately matched to the back EMF of the motor. Full torque is available all the way down to zero speed.

| Diagnostics |  |  | Electrical<br>Installation | Getting<br>Started | Basic<br>parameters | Running the motor | Optimization | SMARTCARD operation |  | Advanced parameters |  | Diagnostics | UL Listing<br>Information |
|-------------|--|--|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|--|---------------------|--|-------------|---------------------------|
|-------------|--|--|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|--|---------------------|--|-------------|---------------------------|

#### 2.3.5 Regen

For use as a regenerative front end for four quadrant operation.

Regen operation allows bi-directional power flow to and from the AC supply. This provides far greater efficiency levels in applications which would otherwise dissipate large amounts of energy in the form of heat in a braking resistor.

The harmonic content of the input current is negligible due to the sinusoidal nature of the waveform when compared to a conventional bridge rectifier or SCR/thyristor front end.

See the Unidrive SP Regen Installation Guide for more information about operation in this mode.

#### 2.4 Compatible encoders

#### Table 2-7 Encoders compatible with Unidrive SP

| Encoder type                                                                                                                                                   | Pr 3.38<br>setting |

#### 2.8 Items supplied with the drive

The drive is supplied with a printed manual, a SMARTCARD, a safety information booklet, the Certificate of Quality, an accessory kit box including the items shown in Table 2-10, and a CD ROM containing all related product documentation and software tools. Table 2-10 Parts supplied with the drive

#### 3 Mechanical Installation

This chapter describes how to use all mechanical details to install the drive. The drive is intended to be installed in an enclosure. Key features of this chapter include:

- Through-hole mounting
- IP54 as standard or through-panel mounting
- Enclosure sizing and layout
- Solutions Module fitting
- Terminal location and torque settings

#### 3.1 Safety information

Follow the instructions

The mechanical and electrical installation instructions must be adhered to. Any questions or doubt should be referred to the supplier of the equipment. It is the responsibility of the owner or user to ensure that the installation of the drive and any external option unit, and the way in which they are operated and maintained, comply with the requirements of the Health and Safety at Work Act in the United Kingdom or applicable legislation and regulations and codes of practice in the country in which the equipment is used.

#### Competence of the installer

The drive must be installed by professional assemblers who are familiar with the requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

Many of the drives in this product range weigh in excess of 15kg (33lb). Use appropriate safeguards when lifting these models.

A full list of drive weights can be found in section 12.1.19 *Weights* on page 266

#### Enclosure

The drive is intended to be mounted in an enclosure which prevents access except by trained and authorized personnel, and which prevents the ingress of contamination. It is designed for use in an environment classified as pollution degree 2 in accordance with IEC 60664-1. This means that only dry, non-conducting contamination is acceptable.

#### 3.2 Planning the installation

The following considerations must be made when planning the installation:

#### 3.2.1 Access

Access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

The IP (Ingress Protection) rating of the drive is installation dependent. For further information, please refer to section 3.9 *Enclosing standard drive for high environmental protection* on page 44.

#### 3.2.2 Environmental protection

The drive must be protected from:

- moisture, including dripping water or spraying water and condensation. An anti-condensation heater may be required, which must be switched off when the drive is running.
- contamination with electrically conductive material
- contamination with any form of dust which may restrict the fan, or impair airflow over various components
- temperature beyond the specified operating and storage ranges
- corrosive gasses

#### NOTE

During installation it is recommended that the vents on the drive are covered to prevent debris (e.g. wire off-cuts) from entering the drive.

#### 3.2.3 Cooling

The heat produced by the drive must be removed without its specified operating temperature being exceeded. Note that a sealed enclosure gives much reduced cooling compared with a ventilated one, and may need to be larger and/or use internal air circulating fans.

For further information, refer to section 3.6.2 *Enclosure sizing* on page 42.

#### 3.2.4 Electrical safety

The installation must be safe under normal and fault conditions. Electrical installation instructions are given in Chapter 4 *Electrical Installation* on page 61.

#### 3.2.5 Fire protection

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided.

#### 3.2.6 Electromagnetic compatibility

Variable speed drives are powerful electronic circuits which can cause electromagnetic interference if not installed correctly with careful attention to the layout of the wiring.

Some simple routine precautions can prevent disturbance to typical industrial control equipment.

If it is necessary to meet strict emission limits, or if it is known that electromagnetically sensitive equipment is located nearby, then full precautions must be observed. In-built into the drive, is an internal EMC filter, which reduces emissions under certain conditions. If these conditions are exceeded, then the use of an external EMC filter may be required at the drive inputs, which must be located very close to the drives. Space must be made available for the filters and allowance made for carefully segregated wiring. Both levels of precautions are covered in section 4.11 *EMC (Electromagnetic compatibility)* on page 75.

#### 3.2.7 Hazardous areas

The drive must not be located in a classified hazardous area unless it is installed in an approved enclosure and the installation is certified.

#### 3.3 Terminal cover removal

#### Isolation device

The AC supply must be disconnected from the drive using an approved isolation device before any cover is removed from the drive or before any servicing work is performed.

#### Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

Normally, the capacitors are discharged by an internal resistor. Under certain, unusual fault conditions, it is possible that the capacitors may fail to discharge, or be prevented from being discharged by a voltage applied to the output terminals. If the drive has failed in a manner that causes the display to go blank immediately, it is possible the capacitors will not be discharged. In this case, consult Control Techniques or their authorized distributor.

#### 3.3.1 Removing the terminal covers

Size 0 is not fitted with any terminal covers.

Size 1 is fitted with two terminal covers: Control and DC terminal covers.

Size 2 is fitted with three terminal covers: Control, High current DC / Braking and low voltage DC terminal covers.

Size 3 is fitted with four terminal covers: Control, High current DC / Braking, low voltage DC and AC terminal covers.

Size 4, 5 and 6 are fitted with three terminal covers: Control, input and output terminal covers.

|  | Safety<br>Information | Product<br>Information | Mechanical<br>Installation | Electrical<br>Installation | Getting<br>Started | Basic<br>paramters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |
|--|-----------------------|------------------------|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|--|-----------------------|------------------------|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

In order to provide access to the mounting holes when a size 1, 2 or 3 drive is through-panel mounted, the control terminal cover must be removed. For size 3 the high current DC / Braking and AC terminal covers must also be removed. Once the drive has been mounted, the terminal covers can be replaced.

Figure 3-1 Location and identification of terminal covers

| Safety         Product         Mechanical<br>Information         Electrical<br>Installation         Getting         Basic           Information         Information         Installation         Installation         Started         paramters | Running<br>the motor Optimization SMART |  | Data Diagnostics UL Listing Information |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|--|-----------------------------------------|
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|--|-----------------------------------------|

To remove a terminal cover, undo the screw and lift the terminal cover off as shown. The control terminal cover must be removed first before the DC (size 1) / low voltage DC (sizes 2 and 3) terminal cover can be removed.

When replacing the terminal covers the screws should be tightened with a maximum torque of 1 N m (0.7 lb ft).

#### Figure 3-2 Removing the size 1 terminal covers

Figure 3-3 Removing the size 2 terminal covers

Figure 3-4 Removing the size 3 terminal covers

Grasp the DC terminal cover break-outs with pliers as shown (1) and twist to remove. Continue until all required break-outs are removed (2).

Remove any flash / sharp edges once the break-outs are removed. Use the DC terminal cover grommets supplied in the accessory box (Table 2-10 on page 24) to maintain the seal at the top of the drive.

Grommets are available for the size 4 to 6 finger-guards. Two versions are available allowing for either single or double cable entries. These are not required if the optional conduit box is installed.

| Safety         Product         Mechanical<br>Installation         Electrical<br>Installation         Getting         Basic         Running<br>the motor         Optimization         SMARTCARD         Onboard         Advanced | Technical<br>Data Diagnostics | UL Listing<br>Information |

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|---------------------------|

#### Figure 3-8 Size 4 to 6 finger-guard grommets

The grommets are available as a kit of four grommets:

#### Kit of four single entry grommets

Kit of four double entry grommets

#### 3.4 Solutions Module / keypad installation / removal

Power down the drive before installing / removing the Solutions Module. Failure to do so may result in damage to the product.

Figure 3-9 Installation of a Solutions Module on size 0

#### NOTE

On size 0 the protective tab from the Solutions Module slot must be removed before attempting to fit a Solutions Module.

To install the Solutions Module, press down in the direction shown above until it clicks into place.

To remove the Solutions Module, press inwards at the points shown (A) and pull in the direction shown (B).

The drive has the facility for all three Solutions Module slots to be used at the same time, as illustrated.

#### NOTE

It is recommended that the Solutions Module slots are used in the following order: slot 3, slot 2 and slot 1.

# 

#### Figure 3-11 Installation of a keypad on size 0

|-------------|--|-----------------------|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

#### Figure 3-12 Installation and removal of a keypad on size 1 to 6

To install, align the keypad and press gently in the direction shown until it clicks into position.

To remove, while pressing the tabs inwards (A), gently lift the keypad in the direction indicated (B).

#### NOTE

The keypad can be installed / removed while the drive is powered up and running a motor, providing that the drive is not operating in keypad mode.

#### 3.5 Mounting methods

Size 0 can be mounted using a DIN rail, either fixed at the top or the bottom of the drive (as illustrated in Figure 3-13). Two screws are required to fix the drive to the backplate at the opposite end to the DIN rail.

Unidrive SP size 1 to 6 units can be either surface or through-panel mounted using the appropriate brackets. Size 0 can only be surface mounted.

The following drawings show the dimensions of the drive and mounting holes for each method to allow a back plate to be prepared.

If the drive has been used at high load levels for a period of time, the heatsink can reach temperatures in excess of 70°C (158°F). Human contact with the heatsink should be prevented.

Many of the drives in this product range weigh in excess of 15kg (33lb). Use appropriate safeguards when lifting these models.

A full list of drive weights can be found in section 12.1.19 *Weights* on page 266

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|

#### 3.5.2 Through-panel mounting

When the drive is through-panel mounted, the main terminal cover(s) must be removed in order to provide access to the mounting holes. Once the drive has been mounted, the terminal cover(s) can be replaced.

#### Figure 3-21 Through-panel mounting the size 1 drive

Figure 3-22 Through-panel mounting the size 2 drive

Figure 3-24 Through-panel mounting the size 4 drive

When a size 4 is through-panel mounted, the grounding link bracket must be folded upwards. This is required to provide a grounding point for the grounding bracket. See section 4.11.1 *Grounding hardware* on page 75 for more information.

Figure 3-25 Through-panel mounting the size 5 drive

When a size 5 is through-panel mounted, the grounding link bracket must be folded upwards. This is required to provide a grounding point for the grounding bracket. See section 4.11.1 *Grounding hardware* on page 75 for more information.

#### NOTE

In order to achieve IP54 rating (NEMA 12) for through-panel mounting, an IP54 insert must be installed (size 1 and 2) and the heatsink fan should be replaced with an IP54 rated fan (sizes 1 to 4). Additionally, the gasket provided should be installed between the drive and the backplate to ensure a good seal for the enclosure. If the heatsink mounted braking resistor is to be used with the drive through-panel mounted, refer to section 3.11 *Internal/heatsink mounted braking resistor* on page 54 prior to mounting the drive. For further information refer to section 3.9 *Enclosing standard drive for high environmental protection* on page 44.

|-------------|---------|--------------|--------------|---------|-----------|-----------|--------------|-----------|---------|------------|-----------|-------------|-------------|
| Information |         | Installation | Installation | Started | paramters | the motor | Optimization | operation | PLC     | parameters | Data      | Diagnostics | Information |

#### Table 3-1 Mounting brackets

To avoid damaging the through-panel mounting bracket when throughpanel mounting a size 1 or size 2, the through-panel mounting bracket should be used to mount the top of the drive to the back plate before the bottom of the drive is mounted to the back plate. The tightening torque should be 4 N m (2.9 lb ft).

## 3.5.3 Installation of the mounting bracket on size 4, 5 and 6

Size 4, 5 and 6 use the same mounting brackets for surface and through-panel mounting.

The mounting bracket has a long section and a short section.

#### Figure 3-27 Size 4, 5 and 6 mounting bracket

The mounting bracket must be installed in the correct orientation with the long section inserted into or attached to the drive and the short section is attached to the back plate. Figure 3-28 shows the orientation of the mounting bracket when the drive is surface and through-panel mounted.

#### Figure 3-28 Orientation of the size 4, 5 and 6 mounting bracket

When through-panel mounted, the mounting brackets on the left hand side of the drive can be secured using the screws already located there. On the right hand side, the mounting brackets are just inserted into the slots in the chasis of the drive; no fixing screws are present here.

Size 5 and 6 also require two top mounting brackets when the drive is surface mounted. The two brackets should be installed to the top of the drive as shown in Figure 3-29.

The maximum torque setting for the screws into the drive chassis is 10 N m (7.4 lb. ft).

Figure 3-29 Location of top surface mounting brackets for size 5 and 6

#### 3.6 Enclosure for standard drives

#### 3.6.1 Enclosure layout

Please observe the clearances in the diagram below taking into account any appropriate notes for other devices / auxiliary equipment when planning the installation.

#### Figure 3-30 Enclosure layout

#### 3.6.2 Enclosure sizing

- 1. Add the dissipation figures from section 12.1.2 *Power dissipation* on page 261 for each drive that is to be installed in the enclosure.
- If an external EMC filter is to be used with each drive, add the dissipation figures from section 12.2.1 *EMC filter ratings* on page 273 for each external EMC filter that is to be installed in the enclosure.
- If the braking resistor is to be mounted inside the enclosure, add the average power figures from for each braking resistor that is to be installed in the enclosure.
- 4. Calculate the total heat dissipation (in Watts) of any other equipment to be installed in the enclosure.
- Add the heat dissipation figures obtained above. This gives a figure in Watts for the total heat that will be dissipated inside the enclosure.

#### Calculating the size of a sealed enclosure

The enclosure transfers internally generated heat into the surrounding air by natural convection (or external forced air flow); the greater the surface area of the enclosure walls, the better is the dissipation capability. Only the surfaces of the enclosure that are unobstructed (not in contact with a wall or floor) can dissipate heat.

Calculate the minimum required unobstructed surface area  $\mathbf{A}_{\mathbf{e}}$  for the enclosure from:

## $\mathbf{A}_{\mathbf{e}} = \frac{\mathbf{P}}{\mathbf{k}(\mathbf{T}_{int} - \mathbf{T}_{ext})}$

#### Where:

- $A_e$  Unobstructed surface area in m<sup>2</sup> (1 m<sup>2</sup> = 10.9 ft<sup>2</sup>)
- T<sub>ext</sub> Maximum expected temperature in <sup>o</sup>C *outside* the enclosure
- T<sub>int</sub> Maximum permissible temperature in <sup>o</sup>C *inside* the enclosure
- P Power in Watts dissipated by *all* heat sources in the enclosure
- k Heat transmission coefficient of the enclosure material in W/m<sup>2</sup>/°C

#### Example

To calculate the size of an enclosure for the following:

- Two SP1406 models operating at the Normal Duty rating
- Each drive to operate at 6kHz PWM switching frequency
- Type1 16 A (4200-6119) external EMC filter for each drive
- Braking resistors are to be mounted outside the enclosure
- Maximum ambient temperature inside the enclosure: 40°C
- Maximum ambient temperature outside the enclosure: 30°C

| Safety<br>Information |  | Mechanical<br>Installation | Electrical<br>Installation | Getting<br>Started | Basic<br>paramters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |
|-----------------------|--|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|-----------------------|--|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

Dissipation of each drive: 187 W (see section 12-4 Losses @ 40°C (104°F) ambient on page 261)

Dissipation of each external EMC filter: 9.2 W (max) (see section 12.2.1 *EMC filter ratings* on page 273)

Total dissipation: 2 x (187 + 9.2) =392.4 W

The enclosure is to be made from painted 2 mm (0.079 in) sheet steel having a heat transmission coefficient of 5.5 W/m<sup>2</sup>/°C. Only the top, front, and two sides of the enclosure are free to dissipate heat.

The value of 5.5 W/m<sup>2</sup>/ $^{\circ}$ C can generally be used with a sheet steel enclosure (exact values can be obtained by the supplier of the material). If in any doubt, allow for a greater margin in the temperature rise.

Insert the following values:

T<sub>int</sub> 40°C

T<sub>ext</sub> 30°C

**k** 5.5

P 392.4 W

The minimum required heat conducting area is then:

$$\mathsf{A}_{\mathsf{e}} = \frac{392.4}{5.5(40-30)}$$

Estimate two of the enclosure dimensions - the height (H) and depth (D), for instance. Calculate the width (W) from:

$$W ~=~ \frac{A_e - 2HD}{H + D}$$

Inserting  $\mathbf{H} = 2m$  and  $\mathbf{D} = 0.6m$ , obtain the minimum width:

$$W = \frac{7.135 - (2 \times 2 \times 0.6)}{2 + 0.6}$$

#### =1.821 m (71.7 in)

If the enclosure is too large for the space available, it can be made smaller only by attending to one or all of the following:

- Using a lower PWM switching frequency to reduce the dissipation in the drives
- Reducing the ambient temperature outside the enclosure, and/or applying forced-air cooling to the outside of the enclosure
- Reducing the number of drives in the enclosure
- Removing other heat-generating equipment

#### Calculating the air-flow in a ventilated enclosure

The dimensions of the enclosure are required only for accommodating the equipment. The equipment is cooled by the forced air flow.

Calculate the minimum required volume of ventilating air from:

$$V = \frac{3kP}{T_{int} - T_{ext}}$$

Where:

Air-flow in m<sup>3</sup> per hour (1 m<sup>3</sup>/hr = 0.59 ft<sup>3</sup>/min)

- T<sub>ext</sub> Maximum expected temperature in °C *outside* the enclosure
- T<sub>int</sub> Maximum permissible temperature in °C *inside* the enclosure
- P Power in Watts dissipated by *all* heat sources in the enclosure

k Ratio of 
$$\frac{P_o}{P_I}$$

Where:

P<sub>0</sub> is the air pressure at sea level

 $\mathbf{P}_{\mathbf{I}}$  is the air pressure at the installation

Typically use a factor of 1.2 to 1.3, to allow also for pressure-drops in dirty air-filters.

#### Example

To calculate the size of an enclosure for the following:

- Three SP1403 models operating at the Normal Duty rating
- Each drive to operate at 6kHz PWM switching frequency
- Type 1 10A (4200-6118) external EMC filter for each drive
- Braking resistors are to be mounted outside the enclosure
- Maximum ambient temperature inside the enclosure: 40°C
- Maximum ambient temperature outside the enclosure: 30°C

#### Dissipation of each drive: 101 W

Dissipation of each external EMC filter: 6.9 W (max)

Total dissipation: 3 x (101 + 6.9) = 323.7 W

Insert the following values:

| T <sub>int</sub> | 40°C    |
|------------------|---------|
| Text             | 30°C    |
| k                | 1.3     |
| Р                | 323.7 W |
| en:              |         |

Th

$$V = \frac{3 \times 1.3 \times 323.7}{40 - 30}$$

= **126.2** m<sup>3</sup>/hr (74.5 ft<sup>3</sup> /min) (1 m<sup>3</sup>/ hr = 0.59 ft<sup>3</sup>/min)

# 3.7 Enclosure design and drive ambient temperature

Drive derating is required for operation in high ambient temperatures Totally enclosing or through panel mounting the drive in either a sealed cabinet (no airflow) or in a well ventilated cabinet makes a significant difference on drive cooling.

The chosen method affects the ambient temperature value  $(T_{rate})$  which should be used for any necessary derating to ensure sufficient cooling for the whole of the drive.

The ambient temperature for the four different combinations is defined below:

- 1. Totally enclosed with no air flow (<2 m/s) over the drive  $T_{rate} = T_{int} + 5^{\circ}C$
- 2. Totally enclosed with air flow (>2 m/s) over the drive  $T_{rate} = T_{int}$
- 3. Through panel mounted with no airflow (<2 m/s) over the drive  $T_{rate}$  = the greater of  $T_{ext}$  +5°C, or  $T_{int}$
- 4. Through panel mounted with air flow (>2 m/s) over the drive  $T_{rate}$  = the greater of  $T_{ext}$  or  $T_{int}$

#### Where:

- T<sub>ext</sub> = Temperature outside the cabinet
- T<sub>int</sub> = Temperature inside the cabinet
- T<sub>rate</sub> = Temperature used to select current rating from tables in Chapter 12 *Technical Data*.

#### 3.8 Heatsink fan operation

The drive is ventilated by an internal heatsink mounted fan. The fan housing forms a baffle plate, channelling the air through the heatsink chamber. Thus, regardless of mounting method (surface mounting or through-panel mounting), the fitting of additional baffle plates is not required.

Ensure the minimum clearances around the drive are maintained to allow air to flow freely.

The heatsink fan on size 0 to 2 is a dual speed fan and on size 3 to 6 it is a variable speed fan. The drive controls the speed at which the fan runs based on the temperature of the heatsink and the drive's thermal model system. The size 3 to 6 is also fitted with a variable speed fan to ventilate the capacitor bank.

The heatsink fan on size 0 to 5 is supplied internally by the drive. The heatsink fan on size 6 requires an external 24Vdc supply. See section 4.4 *Heatsink fan supply* on page 66 for more information.

# 3.9 Enclosing standard drive for high environmental protection

An explanation of environmental protection rating is provided in section 12.1.9 *IP / UL Rating* on page 264.

The standard drive is rated to IP20 pollution degree 2 (dry, nonconductive contamination only) (NEMA 1). However, it is possible to configure the drive to achieve IP54 rating (UL Type 12 / NEMA 12) at the rear of the heatsink for through-panel mounting (some current derating is required for size 1 and 2). Refer to Table 2-43.

This allows the front of the drive, along with various switchgear, to be housed in an IP54 (UL Type 12 / NEMA 12) enclosure with the heatsink protruding through the panel to the external environment. Thus, the majority of the heat generated by the drive is dissipated outside the enclosure maintaining a reduced temperature inside the enclosure. This also relies on a good seal being made between the heatsink and the rear of the enclosure using the gaskets provided.

## For Type 12 the drive must be mounted on a flat surface of a Type 12 enclosure.

#### Figure 3-32 Example of IP54 (UL Type 12 / NEMA 12) throughpanel layout

The main gasket should be installed as shown in Figure 3-33. Any screws / bolts that are used for mounting should be installed with the nylon washers provided in the kit box to maintain a seal around the screw hole. See Figure 3-36.

In order to achieve the high IP rating at the rear of the heatsink with size 1 and 2, it is necessary to seal a heatsink vent by installing the IP54 insert as shown in Figure 3-34 and Figure 3-35.

Figure 3-33 Installing the gasket

In order to remove the IP54 insert, repeat steps (1) (2) and (3), reverse steps (5) and (4) and repeat step (6).

| Safety         Product         Mechanical<br>Information         Electrical<br>Installation         Getting<br>Started         Basic<br>paramters         Running<br>the motor         Optimization | n SMARTCARD Onboard Advanced Technical Diagnostics UL Listing Information |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|

For sizes 4 to 6 it may be necessary to improve the rigidity of the through panel mounting surface due to the larger distance between the top and bottom mounting brackets and the need to maintain compression on the gasket.

When the drive is mounted, if the gap between the drive flange (which the gasket rests on) and the rear wall of the enclosure is  $\geq$ 6mm at any point around the drive then the following methods can be used to compress the gasket further:

- 1. Use a thicker panel for the mounting wall of the enclosure through which the drive is mounted.
- 2. Use an internal backplate to pull the rear wall of the enclosure up to the drive gasket. See Figure 3-36 for details. (Nylon washers are supplied in the standard drive kit for sealing off any nut and bolt fixings that exit through the rear wall of the panel).
- 3. If an internal backplate is not available a separate clamp can be used to simulate option 2. See Figure 3-37. 4 off sealing clamps are supplied in the drive kit box.

#### Figure 3-36 Option 2 for achieving IP54 (UL type 12 / NEMA 12) through-panel mounting

#### Table 3-2Description of fixings

| ltem | Description                |
|------|----------------------------|
| 1    | Bolt                       |
| 2    | Flat washer                |
| 3    | Nylon washer (from kitbox) |
| 4    | Flat washer                |
| 5    | Spring washer              |
| 6    | Nut                        |

#### Table 3-3 Quantity of nylon washers supplied with the drive

| Size | Quantity of M8 (A) | Quantity of M6 (B) |
|------|--------------------|--------------------|
| 1    | 0                  | 3                  |
| 2    | 0                  | 3                  |
| 3    | 0                  | 4                  |
| 4    | 4                  | 4                  |

|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-----------------------------------|--|-------------|---------------------------|

Figure 3-37 Option 3 for achieving IP54 (UL Type 12 / NEMA 12) through panel mounting

For increased fan lifetime in a dirty environment the heatsink fan must be replaced with an IP54 rated fan. Contact the supplier of the drive for details. If the standard fan is used in a dirty/dusty environment, reduced fan lifetime will result. Regular cleaning of the fan and heatsink is recommended in this environment. The heatsink fan installed in sizes 5 and 6 are IP54 rated as standard.

The guidelines in Table 3-4 should be followed.

#### Table 3-4 Environment considerations

| Environment                     | IP54<br>Insert   | Fan      | Comments                                                         |
|---------------------------------|------------------|----------|------------------------------------------------------------------|
| Clean                           | Not<br>installed | Standard |                                                                  |
| Dry, dusty (non-<br>conductive) | Installed        | Standard | Regular cleaning<br>recommended. Fan lifetime<br>may be reduced. |
| Dry, dusty<br>(conductive)      |                  |          | Regular cleaning<br>recommended. Fan lifetime<br>may be reduced. |
| IP54 compliance                 | Installed        | IP54     | Regular cleaning recommended.                                    |

#### NOTE

A current derating must be applied to the size 1 and 2 if the IP54 insert and/or IP54 rated fan are installed. Derating information is provided in section 12.1.1 *Power and current ratings (Derating for switching frequency and temperature)* on page 258.

Failure to do so may result in nuisance tripping.

#### NOTE

When designing an IP54 (NEMA 12) enclosure (Figure 3-32), consideration should be made to the dissipation from the front of the drive.

Table 3-5 Power losses from the front of the drive when throughpanel mounted

| Frame size | Power loss |
|------------|------------|
| 1          | ≤50W       |
| 2          | ≤75W       |
| 3          | ≤100W      |
| 4          | ≤204W      |
| 5          | ≤347W      |
| 6          | ≤480W      |

#### 3.10 External EMC filter

In order to provide our customers with a degree of flexibility, external EMC filters have been sourced from two manufacturers: Type 1 & Type 2. Filter details for each drive rating are provided in the tables below. Both the Type 1 and Type 2 filters meet the same specifications.

Table 3-6 Drive EMC filter details (size 0 to 6)

| Drive            | Туре      | e 1               | Туре 2    | 2                 |
|------------------|-----------|-------------------|-----------|-------------------|
| Drive            |           | Weight            |           | Weight            |
| 1 phase          |           |                   |           |                   |
| SP0201 to SP0205 | 4200-6000 | 1.2 kg (2.64 lb)  |           |                   |
| 3 phase          |           |                   |           |                   |
| SP0201 to SP0205 | 4200-6001 | 1.2 kg (2.64 lb)  |           |                   |
| SP0401 to SP0405 | 4200-6002 | 1.2 kg (2.64 lb)  |           |                   |
| SP1201 to SP1202 | 4200-6118 | - 1.4 kg (3.1 lb) | 4200-6121 | 2.1  kg (4.6  lb) |
| SP1203 to SP1204 | 4200-6119 | 1.4 Kg (3.1 lb)   | 4200-6120 | 2.1 kg (4.6 lb)   |
| SP1401 to SP1404 | 4200-6118 | 1.4 km (2.1 lb)   | 4200-6121 | 2.1 km (1.6 lb)   |
| SP1405 to SP1406 | 4200-6119 | - 1.4 kg (3.1 lb) | 4200-6120 | 2.1 kg (4.6 lb)   |
| SP2201 to SP2203 | 4200-6210 | 2.0 kg (4.4 lb)   | 4200-6211 | 3.3 kg (7.3 lb)   |
| SP2401 to SP2404 | 4200-6210 | 2.0 kg (4.4 lb)   | 4200-6211 | 3.3 kg (7.3 lb)   |
| SP3201 to SP3202 | 4200-6307 | 3.5 kg (7.7 lb)   | 4200-6306 | 5.1 kg (11.2 lb)  |
| SP4201 to SP4203 | 4200-6406 | 4.0 kg (8.8 lb)   | 4200-6405 | 7.8 kg (17.2 lb)  |
| SP5201 to SP5202 | 4200-6503 | 6.8 kg (15.0 lb)  | 4200-6501 | 12.0 kg (26.5 lb) |
| SP3401 to SP3403 | 4200-6305 | 25 k a (7.7 lb)   | 4200-6306 | 5 1 kg (11 0 lb)  |
| SP3501 to SP3507 | 4200-6309 | 3.5 kg (7.7 lb)   | 4200-6308 | 5.1 kg (11.2 lb)  |
| SP4401 to SP4403 | 4200-6406 | 4.0 kg (8.8 lb)   | 4200-6405 | 7.8 kg (17.2 lb)  |
| SP4601 to SP4606 | 4200-6408 | 3.8 kg (8.4 lb)   | 4200-6407 | 8.0 kg (17.6 lb)  |
| SP5401 to SP5402 | 4200-6503 | 6.8 kg (15.0 lb)  | 4200-6501 | 12.0 kg (26.5 lb) |
| SP5601 to SP5602 | 4200-6504 | 4.4 kg (9.7 lb)   | 4200-6502 | 10.0 kg (22.0 lb) |
| SP6401 to SP6402 | 4200-6603 | E 2E kg (11 6 lb) | 4200-6601 | 9.6 kg (10.0 lb)  |
| SP6601 to SP6602 | 4200-6604 | 5.25 kg (11.6 lb) | 4200-6602 | 8.6 kg (19.0 lb)  |

The external EMC filters for sizes 0 to 3 can be footprint or bookcase mounted, see Figure 3-38 and Figure 3-39. The external EMC filters for sizes 4 to 6 are designed to be mounted above the drive, as shown in Figure 3-40.

Mount the external EMC filter following the guidelines in section 4.11.5 Compliance with generic emission standards on page 81.

## 3.11 Internal/heatsink mounted braking resistor

#### 3.11.1 Size 0 internal braking resistor

The size 0 has been designed to accommodate an optional internal resistor. When the internal resistor is used, an external thermal protection device is not required as the resistor is designed such that it will fail safely under fault conditions. The in-built software overload protection is set up at default to protect the resistor.

1. Remove screws

- 2. Remove grill
- 3. Fit the optional internal braking resistor in the slot provided and electrically connect the braking resistor (connections shown in Figure 4-1 on page 61). Ensure that the braking resistor thermistor is connected to the drive
- 4. Locate the braking resistor onto the drive tab
- 5. Refit the grill and mounting screws by reversing the procedure in points 1 and 2

#### 3.11.2 Size 1 and 2 heatsink mounted braking resistor

WARNING

If the drive has been used at high load levels for a period of time, the heatsink and heatsink mounted braking resistor can reach temperatures in excess of 70°C (158°F). Human contact with the heatsink and heatsink mounted braking resistor should be prevented.

To avoid the risk of fire when the drive is surface mounted with the braking resistor installed, the back plate should be a non-flammable material.

The size 1 and 2 have been designed with an optional space-saving heatsink mounted resistor. The resistor can be installed within the heatsink fins of the drive. When the heatsink mounted resistor is used, an external thermal protection device is not required as the resistor is designed such that it will fail safely under fault conditions. The in-built software overload protection is set up at default to protect the resistor. The resistor is rated to IP54 (NFMA12).

If the drive is to be through-panel mounted with the heatsink mounted brake resistor installed, then the aperture in the panel through which the drive is mounted must be modified as shown in Figure 3-48 and Figure 3-49. This is in order to allow for the braking resistor cables and grommets.

Figure 3-49 Through-panel mounting cut-out details for size 2

- An installation sheet
- A wire clip (Size 2 only)

Figure 3-51 Connecting the brake resistor on a surface mounted size 1

- Remove both terminal covers as detailed in section 3.3.1 Removing the terminal covers on page 25.
- Remove the two break-outs that line-up with the BR and +DC terminal connections as detailed in section 3.3.2 Removing the finger-guard and DC terminal cover break-outs on page 28.
- Install the braking resistor to the heatsink as shown in Figure 3-50. The resistor is installed with captive screws.
- The screws should be tightened to a maximum torque of 2 N m (1.5 lb ft).
- Ensure the cables are routed between the fins of the heatsink, and that the cables are not trapped between heatsink fins and the resistor.
- Install the DC terminal cover grommets supplied in the accessory box with the drive, to the cables. To ensure a good seal, the grommets are a tight fit. Lubrication may be required to help install the grommets to the cables.
- Terminate the cables with suitable crimps and connect to the BR and +DC terminals. Tighten the screw terminals to a maximum torque of 1.5 Nm (1.1 lb ft).
- Replace both terminal covers.

#### Figure 3-52 Connecting the brake resistor on a through-panel mounted size 1

Figure 3-54 Modifying the fan baffle on a size 2

Figure 3-55 Fitting the heatsink mounted braking resistor on a size 2

- See Figure 3-48 for through-panel mounting cut-out details.
- Pass the cables through the hole in the panel and install the through-panel grommet.
- Install the through-panel mounting bracket.
- Install the DC terminal cover grommets supplied in the accessory box with the drive, to the cables. To ensure a good seal, the grommets are a tight fit. Lubrication may be required to help install the grommets to the cables.
- Terminate the cables with suitable crimps and connect to the BR and +DC terminals. Tighten the screw terminals to a maximum torque of 1.5 Nm (1.1 lb ft).
- Replace both terminal covers.

- Remove the DC cover as detailed in section 3.3.1 *Removing the terminal covers* on page 25.
- Remove the two break-outs that line-up with the BR and +DC terminal connections as detailed in section 3.3.2 *Removing the finger-guard and DC terminal cover break-outs* on page 28.
- Lift the hinged fan baffle by pushing plastic tabs in the direction shown (1). Push tab in the direction shown (2), and lift the baffle as shown (3).
- Remove the metal heatsink baffle plate by removing the two screws. These two screws are no longer required.
- Remove 5mm (0.197in) from the length of the clip on the plastic fan baffle.
- Install clip to heatsink in the position shown in diagram opposite. Route the long cables of the resistor assembly between the fins of the heatsink as shown in Figure 3-55.
- Install the heatsink baffle plate in place with the cables routed underneath. Ensure the cables are not trapped between a heatsink fin and the baffle plate.
- Install the braking resistors to the heatsink. The resistors are installed with captive screws.
- The screws should be tightened to a maximum torque of 2.0 N m (1.5 lb ft).
- Close the hinged fan baffle.
- Install cables to heatsink clip.

| Safety         Product         Mechanical<br>Information         Electrical<br>Installation         Getting         Basic         Running<br>paramters         Op<br>the motor         Op | Deptimization SMARTCARD Onboard PLC parameters Data Diagnostics UL Listing Information |

#### Figure 3-56 Connecting the brake resistor on a surface mounted size 2

- Install the DC terminal cover grommets supplied in the accessory box with the drive, to the cables. To ensure a good seal, the grommets are a tight fit. Lubrication may be required to help install the grommets to the cables.
- Terminate the cables with suitable crimps and connect to the BR and DC2 terminals.
- Replace the terminal cover.

#### Figure 3-57 Connecting the brake resistor on a through-panel mounted size 2

- See Figure 3-49 for through-panel mounting cut-out details.
- Pass the cables through the hole in the panel and install the hole grommet.
- Install the mounting bracket.
- Install the DC terminal cover grommets supplied in the accessory box with the drive, to the cables. To ensure a good seal, the grommets are a tight fit. Lubrication may be required to help install the grommets to the cables.
- Terminate the cables with suitable crimps and connect to the BR and DC2 terminals.
- Replace the terminal cover.

#### 3.11.5 Braking resistor overload protection parameter settings Failure to observe the following information may damage the resistor.

The drive's software contains an overload protection function for a braking resistor. On size 1 and 2 this function is enabled at default to protect the heatsink mounted resistor. Below are the parameter settings.

| Parameter                          |          | Siz        | e 0        | Size 1 and 2 |            |  |
|------------------------------------|----------|------------|------------|--------------|------------|--|
| i alameter                         |          | 200V drive | 400V drive | 200V drive   | 400V drive |  |
| Full power braking time            | Pr 10.30 | 0.06       | 0.01       | 0.04         | 0.02       |  |
| Full power braking period Pr 10.31 |          | 2.6        | 1.7        | 3            | 3          |  |

For more information on the braking resistor software overload protection, see the Advanced User Guide.

If the heatsink mounted braking resistor is to be used at more than half of its average power rating then the drive's cooling fan must be set to full speed by setting Pr **6.45** to On (1).

See section 4.9.1 *Heatsink mounted braking resistor* on page 72 for the resistor specifications.

## 3.13 Routine maintenance

The drive should be installed in a cool, clean, well ventilated location. Contact of moisture and dust with the drive should be prevented.

Regular checks of the following should be carried out to ensure drive / installation reliability are maximised:

| Environment               |                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ambient temperature       | Ensure the enclosure temperature remains at<br>or below maximum specified                                                                                             |
| Dust                      | Ensure the drive remains dust free – check that<br>the heatsink and drive fan are not gathering<br>dust. The lifetime of the fan is reduced in dusty<br>environments. |
| Moisture                  | Ensure the drive enclosure shows no signs of condensation                                                                                                             |
| Enclosure                 |                                                                                                                                                                       |
| Enclosure door<br>filters | Ensure filters are not blocked and that air is free to flow                                                                                                           |
| Electrical                |                                                                                                                                                                       |
| Screw connections         | Ensure all screw terminals remain tight                                                                                                                               |
| Crimp terminals           | Ensure all crimp terminals remains tight –<br>check for any discoloration which could indicate<br>overheating                                                         |
| Cables                    | Check all cables for signs of damage                                                                                                                                  |

## 4 Electrical Installation

Many cable management features have been incorporated into the product and accessories, this chapter shows how to optimize them. Key features include:

- SAFE TORQUE OFF (SECURE DISABLE) function
- Internal EMC filter
- EMC compliance with shielding / grounding accessories
- Product rating, fusing and cabling information
- Brake resistor details (selection / ratings)

#### Electric shock risk

The voltages present in the following locations can cause severe electric shock and may be lethal:

AC supply cables and connections

- DC and brake cables, and connections
- Output cables and connections
- Many internal parts of the drive, and external option units Unless otherwise indicated, control terminals are single
- insulated and must not be touched.

#### Isolation device

The AC supply must be disconnected from the drive using an approved isolation device before any cover is removed from the drive or before any servicing work is performed.

#### STOP function

The STOP function does not remove dangerous voltages from the drive, the motor or any external option units.

SAFE TORQUE OFF (SECURE DISABLE) function The SAFE TORQUE OFF (SECURE DISABLE) function does not remove dangerous voltages from the drive, the

motor or any external option units.

#### Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

Normally, the capacitors are discharged by an internal resistor. Under certain, unusual fault conditions, it is possible that the capacitors may fail to discharge, or be prevented from being discharged by a voltage applied to the output terminals. If the drive has failed in a manner that causes the display to go blank immediately, it is possible the capacitors will not be discharged. In this case, consult Control Techniques or their authorized distributor.

#### Equipment supplied by plug and socket

Special attention must be given if the drive is installed in equipment which is connected to the AC supply by a plug and socket. The AC supply terminals of the drive are connected to the internal capacitors through rectifier diodes which are not intended to give safety isolation. If the plug terminals can be touched when the plug is disconnected from the socket, a means of automatically isolating the plug from the drive must be used (e.g. a latching relay).

#### Permanent magnet motors

Permanent magnet motors generate electrical power if they are rotated, even when the supply to the drive is disconnected. If that happens then the drive will become

energized through its motor terminals. If the motor load is capable of rotating the motor when the supply is disconnected, then the motor must be isolated from the drive before gaining access to any live parts.

## 4.1 **Power connections**

#### 4.1.1 AC and DC connections

Figure 4-1 Size 0 power connections

When using a 200V Unidrive SP size 0 on a single-phase supply, the live and neutral conductors can be connected to any of the AC input connections on the drive.

If the heatsink mounted resistor is used (size 1 and 2 only), an overload protection device is not required. The resistor is designed to fail safely under fault conditions.

See Figure 4-6 for further information on ground connections.

when using a braking resistor, supplying the drive from DC (low voltage DC) or high voltage DC) or using the drive in a parallel DC bus system. The low current DC connection is used to connect low voltage DC to the drive internal power supply and to connect the internal EMC filter.

See Figure 4-7 for further information on ground connections.

\* See section 4.1.2 Ground connections .

\_\_\_\_

\*\* See section 4.4 Heatsink fan supply on page 66 for more information.

Optional ground connection

|-----------------------|------------------------|----------------------------|----------------------------|--------------------|--------------------|----------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|-----------------------|------------------------|----------------------------|----------------------------|--------------------|--------------------|----------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

## 4.1.2 Ground connections Size 0

On a size 0, the supply and motor ground connections are made using an M6 screw at the top (supply) and bottom (motor) of the drive. See Figure 4-1 on page 61.

#### Size 1

On a size 1, the supply and motor ground connections are made using the studs located either side of the drive near the plug-in power connector. Refer to Figure 4-2 on page 62.

#### Size 2

On a size 2, the supply and motor ground connections are made using the grounding bridge that locates at the bottom of the drive. See Figure 4-6 for details.

#### Size 3

On a size 3, the supply and motor ground connections are made using an M6 nut and bolt that locates in the fork protruding from the heatsink between the AC supply and motor output terminals. See Figure 4-7 for details.

#### Size 4, 5 and 6

On a size 4, 5 and 6, the supply and motor ground connections are made using an M10 bolt at the top (supply) and bottom (motor) of the drive. See Figure 4-8 on page 65.

The supply ground and motor ground connections to the drive are connected internally by a copper conductor with a cross-sectional area given below:

Size 4: 19.2mm<sup>2</sup> (0.03in<sup>2</sup>, or slightly bigger than 6 AWG)

Size 5: 60mm<sup>2</sup> (0.09in<sup>2</sup>, or slightly bigger than 1 AWG)

Size 6: 75mm<sup>2</sup> (0.12in<sup>2</sup>, or slightly bigger than 2/0 AWG)

This connection is sufficient to provide the ground (equipotential bonding) connection for the motor circuit under the following conditions:

| To standard                 | Conditions                                                                                                                                                       |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IEC 60204-1 &<br>EN 60204-1 | Supply phase conductors having cross-sectional area<br>not exceeding:<br>Size 4: 38.4mm <sup>2</sup><br>Size 5: 120mm <sup>2</sup><br>Size 6: 150mm <sup>2</sup> |
| NFPA 79                     | Supply protection device rating not exceeding:<br>Size 4: 200A<br>Size 5: 600A<br>Size 6: 1000A                                                                  |

If the necessary conditions are not met, an additional ground connection must be provided to link the motor circuit ground and the supply ground.

#### Figure 4-6 Size 2 ground connections

#### Figure 4-8 Size 4, 5 and 6 ground connections

The ground loop impedance must conform to the requirements of local safety regulations.

The drive must be grounded by a connection capable of carrying the prospective fault current until the protective device (fuse, etc.) disconnects the AC supply.

The ground connections must be inspected and tested at appropriate intervals.

#### 4.2 AC supply requirements

Voltage:

| SPx2xx | 200V to 240V ±10% |
|--------|-------------------|
| SPx4xx | 380V to 480V ±10% |
| SPx5xx | 500V to 575V ±10% |
| SPx6xx | 500V to 690V ±10% |
|        |                   |

Number of phases: 3\*

\*200V size 0 drives can also be used on a single phase supply.

Maximum supply imbalance: 2% negative phase sequence (equivalent to 3% voltage imbalance between phases).

Frequency range: 48 to 65 Hz

For UL compliance only, the maximum supply symmetrical fault current must be limited to  $100 \mbox{kA}$ 

#### 4.2.1 Supply types

All drives are suitable for use on any supply type i.e TN-S, TN-C-S, TT and IT.

- Supplies with voltage up to 600V may have grounding at any potential, i.e. neutral, centre or corner ("grounded delta")
- Supplies with voltage above 600V may not have corner grounding

Drives are suitable for use on supplies of installation category III and lower, according to IEC60664-1. This means they may be connected permanently to the supply at its origin in a building, but for outdoor installation additional over-voltage suppression (transient voltage surge suppression) must be provided to reduce category IV to category III.

# 

#### Operation with IT (ungrounded) supplies: Special attention is required when using internal or external EMC filters with ungrounded supplies, because in the event of a ground (earth) fault in the motor circuit the drive may not

trip and the filter could be over-stressed. In this case, either the filter must not be used (removed) or additional independent motor ground fault protection must be provided. Refer to Table 4-1.

For instructions on removal, refer to Figure 4-22 *Removal of internal EMC filter and line to ground varistors (size 0)*, Figure 4-23 *Removal of internal EMC filter (size 1 to 3)* and Figure 4-24 *Removal of internal EMC filter (sizes 4 to 6)* on page 78.

For details of ground fault protection contact the supplier of the drive.

A ground fault in the supply has no effect in any case. If the motor must continue to run with a ground fault in its own circuit then an input isolating transformer must be provided and if an EMC filter is required it must be located in the primary circuit.

Unusual hazards can occur on ungrounded supplies with more than one source, for example on ships. Contact the supplier of the drive for more information.

| Drive size | Internal filter only                | External filter (with internal)        |
|------------|-------------------------------------|----------------------------------------|
| 0 (200V)   | May not trip – precautions required | Drive trips on fault                   |
| 0 (400V)   | Drive trips on fault                | Drive trips on fault                   |
| 1 and 2    | Drive trips on fault                | Drive trips on fault                   |
| 3          | May not trip – precautions required | Drive trips on fault                   |
| 4 to 6     | May not trip – precautions required | May not trip – precautions<br>required |

## Table 4-1 Behaviour of the drive in the event of a motor circuit ground (earth) fault with an IT supply

#### 4.2.2 Supplies requiring line reactors

Input line reactors reduce the risk of damage to the drive resulting from poor phase balance or severe disturbances on the supply network.

Where line reactors are to be used, reactance values of approximately 2% are recommended. Higher values may be used if necessary, but may result in a loss of drive output (reduced torque at high speed) because of the voltage drop.

For all drive ratings, 2% line reactors permit drives to be used with a supply unbalance of up to 3.5% negative phase sequence (equivalent to 5% voltage imbalance between phases).

Severe disturbances may be caused by the following factors, for example:

- Power factor correction equipment connected close to the drive.
- Large DC drives having no or inadequate line reactors connected to the supply.
- Across the line (DOL) started motor(s) connected to the supply such that when any of these motors are started, the voltage dip exceeds 20%.

Such disturbances may cause excessive peak currents to flow in the input power circuit of the drive. This may cause nuisance tripping, or in extreme cases, failure of the drive.

Drives of low power rating may also be susceptible to disturbance when connected to supplies with a high rated capacity.

Line reactors are particularly recommended for use with the following drive models when one of the above factors exists, or when the supply capacity exceeds 175kVA:

 SP0201
 SP0202
 SP0203
 SP0204
 SP0205

| IIIIOIIIIalioII       | monnation              | Installation               | Installation               | Stanteu            | paramilers         | the motor            |              | operation              | FLC            | parameters             | Dala              |             | mormation                 |

to SP6602 have internal AC line chokes, so they do not require AC line reactors except for cases of excessive phase unbalance or extreme supply conditions.

When required, each drive must have its own reactor(s). Three individual reactors or a single three-phase reactor should be used.

#### **Reactor current ratings**

The current rating of the line reactors should be as follows:

Continuous current rating:

Not less than the continuous input current rating of the drive

Repetitive peak current rating:

Not less than twice the continuous input current rating of the drive

#### 4.2.3 Input inductor calculation

To calculate the inductance required (at  $\boldsymbol{Y}\%$ ), use the following equation:

$$L = \frac{Y}{100} \times \frac{V}{\sqrt{3}} \times \frac{1}{2\pi f I}$$

Where:

- I = drive rated input current (A)
- L = inductance (H)
- $\mathbf{f} = \text{supply frequency (Hz)}$
- **V** = voltage between lines

# 4.3 Supplying the drive with DC / DC bus paralleling

The connecting of the DC bus between several drives is typically used to:

- 1. Return energy from a drive which is being overhauled by the load to a second motoring drive.
- 2. Allow the use of one braking resistor to dissipate regenerative energy from several drives.

There are limitations to the combinations of drives which can be used in this configuration.

For application data, contact the supplier of the drive.

#### 4.4 Heatsink fan supply

The heatsink fan on size 0 to 5 is supplied internally by the drive. The heatsink fan on size 6 requires an external 24Vdc supply. The connections for the heatsink fan supply must be made to the upper terminal connector near to the W phase output on the drive. Figure 4-9 shows the position of the heatsink fan supply connections.

#### Figure 4-9 Location of the size 6 heatsink fan supply connections

#### Figure 4-10 Size 6 heatsink fan supply connections

The heatsink fan supply requirements are as follows:

| • • • |                           |                                                  |
|-------|---------------------------|--------------------------------------------------|
|       | Nominal voltage:          | 24Vdc                                            |
|       | Minimum voltage:          | 23.5Vdc                                          |
|       | Maximum voltage:          | 27Vdc                                            |
|       | Current drawn:            | 3.3A                                             |
|       | Recommended power supply: | 24V, 100W, 4.5A                                  |
|       | Recommended fuse:         | 4A fast blow (I $^{2}$ t less than 20A $^{2}$ s) |
|       |                           |                                                  |

#### 4.5 Control 24Vdc supply

The 24Vdc input has three main functions.

- It can be used to supplement the drive's own internal 24V when multiple SM-Universal Encoder Plus, SM-Encoder Output Plus, SM-I/O Plus, or SM-I/O 32 modules are being used and the current drawn by these modules is greater than the drive can supply. (If too much current is drawn from the drive, the drive will initiate a 'PS.24V' trip)
- It can be used as a back-up power supply to keep the control circuits of the drive powered up when the line power supply is removed. This allows any fieldbus modules, application modules, encoders or serial communications to continue to operate.

| Safety<br>Information | Product Me<br>Information Ins |  | Electrical<br>nstallation | Getting<br>Started | Basic<br>paramters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |
|-----------------------|-------------------------------|--|---------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|-----------------------|-------------------------------|--|---------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

 It can be used to commission the drive when the line power supply is not available, as the display operates correctly. However, the drive will be in the UV trip state unless either line power supply or low voltage DC operation is enabled, therefore diagnostics may not be possible. (Power down save parameters are not saved when using the 24V back-up power supply input.)

The working voltage range of the 24V power supply is as follows:

| Maximum continuous operating voltage:    | 30.0 V      |
|------------------------------------------|-------------|
| Minimum continuous operating voltage:    | 19.2 V      |
| Nominal operating voltage:               | 24.0 V      |
| Minimum start up voltage:                | 21.6 V      |
| Maximum power supply requirement at 24V: | 60 W        |
| Recommended fuse:                        | 3 A, 50 Vdc |

Minimum and maximum voltage values include ripple and noise. Ripple and noise values must not exceed 5%.

#### 4.6 Low voltage DC power supply

The drive can be operated from low voltage DC supplies, nominally 24Vdc (control) and 48Vdc (power). The low voltage DC power operating mode is designed either, to allow for motor operation in an emergency back-up situation following failure of the AC supply, for example in elevators; or to limit the speed of a servo motor during commissioning / start-up of equipment, for example a robot cell.

The working voltage range of the low voltage DC power supply is as follows:

#### Size 0

| 3120 0                                                             |            |
|--------------------------------------------------------------------|------------|
| Minimum continuous operating voltage:<br>Minimum start up voltage: | 36V<br>40V |
| Nominal continuous operating voltage:                              | 48 to 72V  |
| Maximum braking IGBT turn on voltage:                              | 95.4V      |
| Maximum over voltage trip threshold:                               | 104.4V     |
| Size 1                                                             |            |
| Minimum continuous operating voltage:                              | 36V        |
| Minimum start up voltage:                                          | 40V        |
| Nominal continuous operating voltage:                              | 48V        |

| Maximum over voltage trip threshold:                               | 69.6V      |
| Size 2 and 3                                                       |            |
| Minimum continuous operating voltage:                              | 36V        |
| Minimum start up voltage:                                          | 40V        |
| Nominal continuous operating voltage:                              | 48 to 72V  |
| Maximum braking IGBT turn on voltage:                              | 95.4V      |
| Maximum over voltage trip threshold:                               | 104.4V     |
| Size 4 (200V drives)                                               |            |
| Minimum continuous operating voltage:                              | 36V        |
| Nominal continuous operating voltage:                              | 48 to 72V  |
| Maximum braking IGBT turn on voltage:                              | 95.4V      |
| Maximum over voltage trip threshold:                               | 104.4V     |
| Size 4, 5 and 6 (400V and 690V drives)                             |            |
| Minimum continuous operating voltage:                              | 36V        |
| Nominal continuous operating voltage:                              | 48 to 96V  |
| Maximum braking IGBT turn on voltage:                              | 127.2V     |
| Maximum over voltage trip threshold:                               | 139.2V     |
|                                                                    |            |

See section 4.5 *Control 24Vdc supply* on page 66 for 24V back-up to control.

#### NOTE

The nominal low voltage supply level is set by the user in Pr **6.46**. The default setting is 48V for all drive sizes. The over voltage trip threshold and braking IGBT turn on voltage are scaled from this value as follows:

Brake IGBT turn on = 1.325 x Pr 6.46 (V)

Over voltage trip = 1.45 x Pr 6.46 (V)

For application data, refer to the Unidrive SP Low Voltage DC Operation Installation Guide.

#### 4.7 Ratings

The input current is affected by the supply voltage and impedance.

#### **Typical input current**

The values of typical input current are given to aid calculations for power flow and power loss.

The values of typical input current are stated for a balanced supply.

#### Maximum continuous input current

The values of maximum continuous input current are given to aid the selection of cables and fuses. These values are stated for the worst case condition with the unusual combination of stiff supply with bad balance. The value stated for the maximum continuous input current would only be seen in one of the input phases. The current in the other two phases would be significantly lower.

The values of maximum input current are stated for a supply with a 2% negative phase-sequence imbalance and rated at the supply fault current given in Table 4-2.

#### Table 4-2 Supply fault current used to calculate maximum input currents

#### Installation class (ref: IEC60364-5-52:2001)

B1 - Separate cables in conduit.

B2 - Multicore cable in conduit C - Multicore cable in free air.

#### NOTE

Cable sizes are from IEC60364-5-52:2001 table A.52.C with correction factor for 40°C ambient of 0.87 (from table A52.14) for cable installation method B2 (multicore cable in conduit).

Cable size may be reduced if a different installation method is used, or if the ambient temperature is lower.

The recommended cable sizes above are only a guide. The mounting and grouping of cables affects their current-carrying capacity, in some cases smaller cables may be acceptable but in other cases a larger cable is required to avoid excessive temperature or voltage drop. Refer to local wiring regulations for the correct size of cables.

#### NOTE

The recommended output cable sizes assume that the motor maximum current matches that of the drive. Where a motor of reduced rating is used the cable rating may be chosen to match that of the motor. To ensure that the motor and cable are protected against overload, the drive must be programmed with the correct motor rated current.

UL listing is dependent on the use of the correct type of UL-listed fuse, and applies when symmetrical short-circuit current does not exceed 100kA. See Chapter 14 UL Listing Information on page 294 for sizing information.

Fuses The AC supply to the drive must be installed with suitable protection against overload and short-circuits. Table 4-3, Table 4-4 and Table 4-5 show recommended fuse ratings. WARNING Failure to observe this requirement will cause risk of fire.

A fuse or other protection must be included in all live connections to the AC supply.

An MCB (miniature circuit breaker) or MCCB (moulded-case circuitbreaker) with type C may be used in place of fuses on sizes 1 to 3 under the following conditions:

- The fault-clearing capacity must be sufficient for the installation
- For frame sizes 2 and 3, the drive must be mounted in an enclosure which meets the requirements for a fire enclosure

See Chapter 14 UL Listing Information for UL listing requirements.

#### Fuse types

The fuse voltage rating must be suitable for the drive supply voltage.

#### **Ground connections**

The drive must be connected to the system ground of the AC supply. The ground wiring must conform to local regulations and codes of practice.

#### Main AC supply contactor 4.7.1

The recommended AC supply contactor type for sizes 0 to 6 is AC1.

#### 4.8 Output circuit and motor protection

The output circuit has fast-acting electronic short-circuit protection which limits the fault current to typically no more than five times the rated output current, and interrupts the current in approximately 20µs. No additional short-circuit protection devices are required.

The drive provides overload protection for the motor and its cable. For this to be effective, Pr **0.46** *Motor rated current* must be set to suit the motor.

Pr 0.46 *Motor rated current* must be set correctly to avoid a risk of fire in the event of motor overload.

There is also provision for the use of a motor thermistor to prevent overheating of the motor, e.g. due to loss of cooling.

#### 4.8.1 Cable types and lengths

Since capacitance in the motor cable causes loading on the output of the drive, ensure the cable length does not exceed the values given in Table 4-6, Table 4-7 and Table 4-8.

Use 105°C (221°F) (UL 60/75°C temp rise) PVC-insulated cable with copper conductors having a suitable voltage rating, for the following power connections:

- AC supply to external EMC filter (when used)
- AC supply (or external EMC filter) to drive
- Drive to motor
- Drive to braking resistor

- Cable lengths in excess of the specified values may be used only when special techniques are adopted; refer to the supplier of the drive.
- The default switching frequency is 3kHz for open-loop and closedloop vector and 6kHz for servo.

#### **High-capacitance cables**

The maximum cable length is reduced from that shown in Table 4-6, Table 4-7, Table 4-8 and Table 4-9 if high capacitance motor cables are used.

Most cables have an insulating jacket between the cores and the armor or shield; these cables have a low capacitance and are recommended. Cables that do not have an insulating jacket tend to have high

capacitance; if a cable of this type is used, the maximum cable length is half that quoted in the tables. (Figure 4-11 shows how to identify the two types.)

#### Figure 4-11 Cable construction influencing the capacitance

Normal capacitance Shield or armour separated from the cores

High capacitance Shield or armour close to the cores

The cable used for Table 4-6, Table 4-7, Table 4-8 and Table 4-9 is shielded and contains four cores. Typical capacitance for this type of cable is 130pF/m (i.e. from one core to all others and the shield connected together).

#### 4.8.2 Motor winding voltage

The PWM output voltage can adversely affect the inter-turn insulation in the motor. This is because of the high rate of change of voltage, in conjunction with the impedance of the motor cable and the distributed nature of the motor winding.

For normal operation with AC supplies up to 500Vac and a standard motor with a good quality insulation system, there is no need for any special precautions. In case of doubt the motor supplier should be consulted.

Special precautions are recommended under the following conditions, but only if the motor cable length exceeds 10m:

- AC supply voltage exceeds 500V
- DC supply voltage exceeds 670V
- Operation of 400V drive with continuous or very frequent sustained braking
- Multiple motors connected to a single drive

For multiple motors, the precautions given in section 4.8.3 *Multiple motors* should be followed.

For the other cases listed, it is recommended that an inverter-rated motor be used. This has a reinforced insulation system intended by the manufacturer for repetitive fast-rising pulsed voltage operation.

Users of 575V NEMA rated motors should note that the specification for inverter-rated motors given in NEMA MG1 section 31 is sufficient for motoring operation but not where the motor spends significant periods braking. In that case an insulation peak voltage rating of 2.2kV is recommended.

If it is not practical to use an inverter-rated motor, an output choke (inductor) should be used. The recommended type is a simple iron-cored component with a reactance of about 2%. The exact value is not critical. This operates in conjunction with the capacitance of the motor cable to increase the rise-time of the motor terminal voltage and prevent excessive electrical stress.

#### 4.8.3 Multiple motors

#### **Open-loop only**

If the drive is to control more than one motor, one of the fixed V/F modes should be selected (Pr 5.14 = Fd or SrE). Make the motor connections as shown in Figure 4-12 and Figure 4-13. The maximum cable lengths in Table 4-6, Table 4-7, Table 4-8 and Table 4-9 apply to the sum of the total cable lengths from the drive to each motor.

It is recommended that each motor is connected through a protection relay since the drive cannot protect each motor individually. For  $\lambda$  connection, a sinusoidal filter or an output inductor must be connected as shown in Figure 4-13, even when the cable lengths are less than the maximum permissible. For details of inductor sizes refer to the supplier of the drive. Figure 4-12 Preferred chain connection for multiple motors

#### Figure 4-13 Alternative connection for multiple motors

#### 4.8.4 $\land / \triangle$ motor operation

The voltage rating for A and  $\Delta$  connections of the motor should always be checked before attempting to run the motor.

The default setting of the motor rated voltage parameter is the same as the drive rated voltage, i.e.

400V drive 400V rated voltage 200V drive 200V rated voltage

A typical 3 phase motor would be connected in  $\checkmark$  for 400V operation or  $\triangle$  for 200V operation, however, variations on this are common e.g.  $\bigstar$  690V  $\triangle$  400V

Incorrect connection of the windings will cause severe under or over fluxing of the motor, leading to a very poor output torque or motor saturation and overheating respectively.

#### 4.8.5 Output contactor

If the cable between the drive and the motor is to be interrupted by a contactor or circuit breaker, ensure that the drive is disabled before the contactor or circuit breaker is opened or closed. Severe arcing may occur if this circuit is interrupted with the motor running at high current and low speed.

A contactor is sometimes required to be installed between the drive and motor for safety purposes.

The recommended motor contactor is the AC3 type.

Switching of an output contactor should only occur when the output of the drive is disabled.

Opening or closing of the contactor with the drive enabled will lead to:

- 1. OI.AC trips (which cannot be reset for 10 seconds)
- 2. High levels of radio frequency noise emission
- 3. Increased contactor wear and tear

The Drive Enable terminal (T31) when opened provides a SAFE TORQUE OFF (SECURE DISABLE) function. This can in many cases replace output contactors.

For further information see section 4.16 SAFE TORQUE OFF (SECURE DISABLE) on page 93.

#### 4.9 Braking

Braking occurs when the drive is decelerating the motor, or is preventing the motor from gaining speed due to mechanical influences. During braking, energy is returned to the drive from the motor.

When the motor is being braked by the drive, the maximum regenerated power that the drive can absorb is equal to the power dissipation (losses) of the drive.

When the regenerated power is likely to exceed these losses, the DC bus voltage of the drive increases. Under default conditions, the drive brakes the motor under PI control, which extends the deceleration time as necessary in order to prevent the DC bus voltage from rising above a user defined set-point.

If the drive is expected to rapidly decelerate a load, or to hold back an overhauling load, a braking resistor must be installed.

Table 4-10 shows the DC voltage level at which the drive turns on the braking transistor.

#### Table 4-10 Braking transistor turn on voltage

| Drive voltage rating | DC bus voltage level |  |  |  |  |  |
|----------------------|----------------------|--|--|--|--|--|
| 200V                 | 390V                 |  |  |  |  |  |
| 400V                 | 780V                 |  |  |  |  |  |
| 575V                 | 930V                 |  |  |  |  |  |
| 690V                 | 1120V                |  |  |  |  |  |

#### NOTE

When a braking resistor is used, Pr **0.15** should be set to FASt ramp mode.

#### High temperatures

Braking resistors can reach high temperatures. Locate braking resistors so that damage cannot result. Use cable having insulation capable of withstanding high temperatures.

#### 4.9.1 Heatsink mounted braking resistor

A resistor has been especially designed to be mounted internal to the drive (size 0) or within the heatsink of the drive (sizes 1 and 2). See section 3.11 *Internal/heatsink mounted braking resistor* on page 54 for mounting details. The design of the resistor is such that no thermal protection circuit is required, as the device will fail safely under fault conditions. On sizes 0, 1 and 2, the in built software overload protection is set up at default for the designated heatsink mounted resistor. Table 4-11 provides the resistor data for each drive rating.

The internal braking resistor for size 0 is fitted with a thermistor which must be connected to the drive whenever the internal braking resistor in installed.

#### NOTE

The internal/heatsink mounted resistor is suitable for applications with a low level of regen energy only. See Table 4-11.

|             |             |              |              |         |           |           | 1              | 1         |         |            |           |                |             |

## Failure to observe the following information may damage the resistor.

The drive's software contains an overload protection

function for a braking resistor. On size 0 to 2 this function is enabled at default to protect the heatsink mounted resistor. Below are the parameter settings.

|                              |                 | Siz           | e 0           | Size 1 and 2  |               |  |
|------------------------------|-----------------|---------------|---------------|---------------|---------------|--|
| Parame                       | ter             | 200V<br>drive | 400V<br>drive | 200V<br>drive | 400V<br>drive |  |
| Full power<br>braking time   | Pr <b>10.30</b> | 0.06          | 0.01          | 0.04          | 0.02          |  |
| Full power<br>braking period | Pr <b>10.31</b> | 2.6           | 1.7           | 3             | .3            |  |

For more information on the braking resistor software overload protection, see Pr **10.30** and Pr **10.31** full descriptions in the *Advanced User Guide*.

If the heatsink mounted braking resistor is to be used at more than half of its average power rating then the drive's cooling fan must be at full speed controlled by setting Pr **6.45** to On (1).

### Table 4-11 Heatsink mounted braking resistor data

| Parameter                                                     | Size 0   | Size 1 | Size 2 |
|---------------------------------------------------------------|----------|--------|--------|
|                                                               | 700      | 750    | 27.50  |
| DC resistance at 25°C                                         | 70Ω      | 75Ω    | 37.5Ω  |
| Peak instantaneous power<br>over 1ms at nominal<br>resistance | 8.7kW    | 8kW    | 16kW   |
| Average power over 60s *                                      | 50W      | 50W    | 100W   |
| Ingress Protection (IP)<br>rating                             | N/A IP54 |        | 54     |
| Maximum altitude                                              |          | 2000m  |        |

\* To keep the temperature of the resistor below  $70^{\circ}$ C ( $158^{\circ}$ F) in a  $30^{\circ}$ C ( $86^{\circ}$ F) ambient, the average power rating is 50W for size 1 and 100W for size 2. The above parameter settings ensure this is the case.

Size 3 and larger do not have heatsink mounted braking resistors, hence the default values of Pr **10.30** and Pr **10.31** are 0 (i.e. software braking resistor overload protection disabled).

The internal braking resistor for size 0 can be used with the drive even though its resistance is lower than the minimum resistance values given in Table 4-12, because of the following reasons.

- The braking resistor overload protection function in the drive is set up to limit the power dissipated in the resistor
- The braking resistor is fitted with a thermistor which will trip the drive if the resistor is too hot
- The power rating of the resistor is only 50W

If an external resistor is used with the drive, its resistance must be equal to or greater than the value given in Table 4-12.

## 4.9.2 External braking resistor

CAUTION

Overload protection

When an external braking resistor is used, it is essential that an overload protection device is incorporated in the braking resistor circuit; this is described in Figure 4-14 on page 74.

When a braking resistor is to be mounted outside the enclosure, ensure that it is mounted in a ventilated metal housing that will perform the following functions:

- Prevent inadvertent contact with the resistor
- Allow adequate ventilation for the resistor

When compliance with EMC emission standards is required, external

connection requires the cable to be armored or shielded, since it is not fully contained in a metal enclosure. See section 4.11.5 *Compliance with generic emission standards* on page 81 for further details.

Internal connection does not require the cable to be armored or shielded.

### Minimum resistances and power ratings

### Table 4-12 Minimum resistance values and peak power rating for the braking resistor at 40°C (104°F)

\* Resistor tolerance: ±10%

\*\* The power ratings specified are for a stand-alone drive only. If the drive is part of a common DC bus system different ratings must be used. Contact the supplier of the drive for more information.

For high-inertia loads or under continuous braking, the *continuous power* dissipated in the braking resistor may be as high as the power rating of the drive. The total *energy* dissipated in the braking resistor is dependent on the amount of energy to be extracted from the load.

The instantaneous power rating refers to the short-term maximum power dissipated during the *on* intervals of the pulse width modulated braking control cycle. The braking resistor must be able to withstand this dissipation for short intervals (milliseconds). Higher resistance values require proportionately lower instantaneous power ratings.

In most applications, braking occurs only occasionally. This allows the continuous power rating of the braking resistor to be much lower than the power rating of the drive. It is essential, though, that the instantaneous power rating and energy rating of the braking resistor are sufficient for the most extreme braking duty that is likely to be encountered.

Optimization of the braking resistor requires a careful consideration of the braking duty.

Select a value of resistance for the braking resistor that is not less than the specified minimum resistance. Larger resistance values may give a cost saving, as well as a safety benefit in the event of a fault in the braking system. Braking capability will then be reduced, which could cause the drive to trip during braking if the value chosen is too large.

### Thermal protection circuit for the braking resistor

The thermal protection circuit must disconnect the AC supply from the drive if the resistor becomes overloaded due to a fault. Figure 4-14 shows a typical circuit arrangement.

See Figure 4-2 on page 62, Figure 4-3 and Figure 4-4 on page 63, and Figure 4-5 on page 63 for the location of the +DC and braking resistor connections.

### 4.9.3 Braking resistor software overload protection

The drive software contains an overload protection function for a braking resistor. In order to enable and set-up this function, it is necessary to enter two values into the drive:

- Resistor short-time overload time (Pr 10.30)
- Resistor minimum time between repeated short-time overloads (Pr 10.31)

This data should be obtained from the manufacturer of the braking resistors.

Pr **10.39** gives an indication of braking resistor temperature based on a simple thermal model. Zero indicates the resistor is close to ambient and 100% is the maximum temperature the resistor can withstand. A br.rS alarm is given if this parameter is above 75% and the braking IGBT is active. An It.br trip will occur if Pr **10.39** reaches 100%, when Pr **10.37** is set to 0 (default value) or 1.

If Pr **10.37** is equal to 2 or 3 an It.br trip will not occur when Pr **10.39** reaches 100%, but instead the braking IGBT will be disabled until Pr **10.39** falls below 95%. This option is intended for applications with parallel connected DC buses where there are several braking resistors, each of which cannot withstand full DC bus voltage continuously. With this type of application it is unlikely the braking energy will be shared equally between the resistors because of voltage measurement tolerances within the individual drives. Therefore with Pr **10.37** set to 2 or 3, then as soon as a resistor has reached its maximum temperature the drive will disable the braking IGBT, and another resistor on another drive will take up the braking energy. Once Pr **10.39** has fallen below 95% the drive will allow the braking IGBT to operate again.

See the *Advanced User Guide* for more information on Pr **10.30**, Pr **10.31**, Pr **10.37** and Pr **10.39**.

This software overload protection should be used in addition to an external overload protection device.

#### 4.10 Ground leakage

The ground leakage current depends upon whether the internal EMC filter is installed. The drive is supplied with the filter installed. Instructions for removing the internal filter are given in Figure 4-23 Removal of internal EMC filter (size 1 to 3) and Figure 4-24 Removal of internal EMC filter (sizes 4 to 6) on page 78.

### With internal filter installed:

Size 0: 12mA\* AC at 400V 50Hz

 $30\mu A DC$  with a 600V DC bus  $(10M\Omega)$ 

Size 1 to 3: 28mA\* AC at 400V 50Hz

30µA DC with a 600V DC bus (10MΩ)

### Size 4 to 6: 56mA\* AC at 400V 50Hz

18µA DC with a 600V DC bus  $(33M\Omega)$ 

\* Proportional to the supply voltage and frequency.

### With internal filter removed:

<1mA

Note that in both cases there is an internal voltage surge protection device connected to ground. Under normal circumstances this carries negligible current.

When the internal filter is installed the leakage current is high. In this case a permanent fixed ground connection must be provided, or other suitable measures taken to prevent a safety hazard occurring if the connection is lost.

#### 4.10.1 Use of residual current device (RCD)

- There are three common types of ELCB / RCD:
- 1. AC detects AC fault currents
- A detects AC and pulsating DC fault currents (provided the DC 2. current reaches zero at least once every half cycle)
- 3. B detects AC, pulsating DC and smooth DC fault currents
  - Type AC should never be used with drives.
  - Type A can only be used with single phase drives
  - Type B must be used with three phase drives

Only type B ELCB / RCD are suitable for use with 3 phase inverter drives.

If an external EMC filter is used, a delay of at least 50ms should be incorporated to ensure spurious trips are not seen. The leakage current is likely to exceed the trip level if all of the phases are not energized simultaneously.

#### 4.11 EMC (Electromagnetic compatibility)

The requirements for EMC are divided into three levels in the following three sections

Section 4.11.3, General requirements for all applications, to ensure reliable operation of the drive and minimise the risk of disturbing nearby equipment. The immunity standards specified in section 11 will be met, but no specific emission standards. Note also the special requirements given in Surge immunity of control circuits - long cables and connections outside a building on page 83 for increased surge immunity of control circuits where control wiring is extended.

### Section 4.11.4, Requirements for meeting the EMC standard for power drive systems, IEC61800-3 (EN61800-3).

Section 4.11.5, Requirements for meeting the generic emission standards for the industrial environment, IEC61000-6-4, EN61000-6-4, EN50081-2.

The recommendations of section 4.11.3 will usually be sufficient to avoid causing disturbance to adjacent equipment of industrial quality. If particularly sensitive equipment is to be used nearby, or in a nonindustrial environment, then the recommendations of section 4.11.4 or

section 4.11.5 should be followed to give reduced radio-frequency emission

In order to ensure the installation meets the various emission standards described in:

- The EMC data sheet available from the supplier of the drive
- The Declaration of Conformity at the front of this manual
- Chapter 12 Technical Data on page 258

...the correct external EMC filter must be used and all of the guidelines in section 4.11.3 General requirements for EMC and section 4.11.5 Compliance with generic emission standards must be followed.

### High ground leakage current

When an EMC filter is used, a permanent fixed ground connection must be provided which does not pass through a connector or flexible power cord. This includes the internal WARNING EMC filter.

### NOTE

The installer of the drive is responsible for ensuring compliance with the EMC regulations that apply where the drive is to be used.

#### Grounding hardware 4.11.1

The drive is supplied with a grounding bracket, and sizes 1 to 3 with a grounding clamp, to facilitate EMC compliance. They provide a convenient method for direct grounding of cable shields without the use of "pig-tails". Cable shields can be bared and clamped to the grounding

bracket using metal clips or clamps<sup>1</sup> (not supplied) or cable ties. Note that the shield must in all cases be continued through the clamp to the intended terminal on the drive, in accordance with the connection details for the specific signal.

<sup>1</sup> A suitable clamp is the Phoenix DIN rail mounted SK14 cable clamp (for cables with a maximum outer diameter of 14mm).

See Figure 4-15 for details of using the grounded metal panel on size 0.

See Figure 4-16 and Figure 4-17 for details on installing the grounding clamp.

See Figure 4-18 and Figure 4-19 for details on installing the grounding bracket.

Figure 4-21 Size 4 and 5 grounding link bracket folded up into its through- panel mount position

### 4.11.2 Internal EMC filter

It is recommended that the internal EMC filter be kept in place unless there is a specific reason for removing it.

If the drive is used as a motoring drive as part of a Unidrive SP regen system, then the internal EMC filter must be removed.

The internal EMC filter reduces radio-frequency emission into the line power supply. Where the motor cable is short, it permits the requirements of EN61800-3 to be met for the second environment - see section 4.11.4 *Compliance with EN 61800-3* (standard for Power Drive Systems) on page 80 and section 12.1.24 *Electromagnetic compatibility (EMC)* on page 270. For longer motor cables the filter continues to provide a useful reduction in emission level, and when used with any length of shielded motor cable up to the limit for the drive, it is unlikely that nearby industrial equipment will be disturbed. It is recommended that the filter be used in all applications unless the instructions given above require it to be removed or the ground leakage current of 12mA for size 0, 28mA for size 1 to 3 or 56mA for size 4 to 6 is unacceptable. See Figure 4-22, Figure 4-23 and Figure 4-24 for details of removing and installing the internal EMC filter.

Figure 4-22 Removal of internal EMC filter and line to ground varistors (size 0)

The supply must be disconnected before removing the internal EMC filter or line to ground varistor screws.

- 1. Internal EMC filter. Remove the bottom screw as shown.
- 2. Line to ground varistors. Remove the top screw as shown.

### NOTE

The line to ground varistors should only be removed in special circumstances.

### Figure 4-23 Removal of internal EMC filter (size 1 to 3)

# 4.11.3 General requirements for EMC Ground (earth) connections

The grounding arrangements should be in accordance with Figure 4-25, which shows a single drive on a back-plate with or without an additional enclosure.

Figure 4-25 shows how to manage EMC when using an unshielded motor cable. However a shielded cable is preferable, in which case it should be installed as shown in section 4.11.5 *Compliance with generic emission standards* on page 81.

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|

### Cable layout

Figure 4-26 indicates the clearances which should be observed around the drive and related 'noisy' power cables by all sensitive control signals / equipment.

### Figure 4-26 Drive cable clearances

### NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the motor cable, to avoid this noise current spreading through the control system.

### Feedback device cable shielding

Shielding considerations are important for PWM drive installations due to the high voltages and currents present in the output (motor) circuit with a very wide frequency spectrum, typically from 0 to 20 MHz.

The following guidance is divided into two parts:

- 1. Ensuring correct transfer of data without disturbance from electrical noise originating either within the drive or from outside.
- 2. Additional measures to prevent unwanted emission of radio frequency noise. These are optional and only required where the installation is subject to specific requirements for radio frequency emission control.

To ensure correct transfer of data, observe the following: Resolver connections:

- Use a cable with an overall shield and twisted pairs for the resolver signals
- Connect the cable shield to the drive 0V connection by the shortest possible link ("pigtail")
- It is generally preferable not to connect the cable shield to the resolver. However in cases where there is an exceptional level of common-mode noise voltage present on the resolver body, it may be helpful to connect the shield there. If this is done then it becomes essential to ensure the absolute minimum length of "pigtails" at both shield connections, and possibly to clamp the cable shield directly to the resolver body and to the drive grounding bracket.
- The cable should preferably not be interrupted. If interruptions are unavoidable, ensure the absolute minimum length of "pigtail" in the shield connections at each interruption.

### Encoder connections:

- Use a cable with the correct impedance
- Use a cable with individually shielded twisted pairs
- Connect the cable shields to 0V at both the drive and the encoder, using the shortest possible links ("pigtails")
- The cable should preferably not be interrupted. If interruptions are unavoidable, ensure the absolute minimum length of "pigtail" in the shield connections at each interruption. Preferably, use a connection method which provides substantial metallic clamps for the cable shield terminations.

The above applies where the encoder body is isolated from the motor and where the encoder circuit is isolated from the encoder body. Where there is no isolation between the encoder circuits and the motor body, and in case of doubt, the following additional requirement must be observed. This gives the best possible noise immunity.

 The shields must be directly clamped to the encoder body (no pigtail) and to the drive grounding bracket. This may be achieved by clamping of the individual shields or by providing an additional overall shield which is clamped.

### NOTE

The recommendations of the encoder manufacturer must also be adhered to for the encoder connections.

### NOTE

In order to guarantee maximum noise immunity for any application double shielded cable as shown should be used.

In some cases single shielding of each pair of differential signals cables, or a single overall shield with individual shield on the thermistor connections is sufficient. In these cases all the shields should be connected to ground and 0V at both ends.

If the 0V is required to be left floating a cable with individual shields and an overall shield must be used.

Figure 4-27 and Figure 4-28 illustrate the preferred construction of cable and the method of clamping. The outer sheath of the cable should be stripped back enough to allow the clamp to be installed. The shield must not be broken or opened at this point. The clamps should be installed close to the drive or feedback device, with the ground connections made to a ground plate or similar metallic ground surface.

### Figure 4-27 Feedback cable, twisted pair

# To ensure suppression of radio frequency emission, observe the following:

- Use a cable with an overall shield
- Clamp the overall shield to grounded metallic surfaces at both the encoder and the drive, as illustrated in Figure 4-28

### 4.11.4 Compliance with EN 61800-3 (standard for Power Drive Systems)

Meeting the requirements of this standard depends on the environment that the drive is intended to operate in, as follows:

### Operation in the first environment

Observe the guidelines given in section 4.11.5 *Compliance with generic emission standards* on page 81. An external EMC filter will always be required.

This is a product of the restricted distribution class according to IEC 61800-3

In a residential environment this product may cause radio interference in which case the user may be required to take adequate measures.

### Operation in the second environment

In all cases a shielded motor cable must be used, and an EMC filter is required for all Unidrive SPs with a rated input current of less than 100A.

The drive contains an in-built filter for basic emission control. In some cases feeding the motor cables (U, V and W) once through a ferrite ring can maintain compliance for longer cable lengths. The requirements of operating in the second environment are met, depending on the motor cable length for 3kHz switching frequency as stated in Table 4-14 and Table 4-15.

Table 4-14 Second environment emission compliance (size 0)

| ľ | Drive Filter |            | Voltage | Motor cable length (m) |         |            |  |  |  |  |

Key:

Restricted:EN 61800-3 second environment, restricted distribution (Additional measures may be required to prevent interference)

Unrestricted: EN 61800-3 second environment, unrestricted distribution

For longer motor cables, an external filter is required. Where a filter is required, follow the guidelines in section 4.11.5 *Compliance with generic emission standards*.

Where a filter is not required, follow the guidelines given in section 4.11.3 *General requirements for EMC* on page 78.

The second environment typically includes an industrial lowvoltage power supply network which does not supply buildings used for residential purposes. Operating the drive in this environment without an external EMC filter may cause interference to nearby electronic equipment whose sensitivity has not been appreciated. The user must take remedial measures if this situation arises. If the consequences of unexpected disturbances are severe, it is recommended that the guidelines in section 4.11.5 *Compliance with generic* 

Refer to section 12.1.24 *Electromagnetic compatibility (EMC)* on page 270 for further information on compliance with EMC standards and definitions of environments.

emission standards be adhered to.

Detailed instructions and EMC information are given in the *EMC Data Sheet* which is available from the supplier of the drive.

### 4.11.5 Compliance with generic emission standards

The following information applies to frame sizes 0 to 5.

Size 6 upwards does not comply with the requirements of the generic standards for radiated emission.

Size 6 complies with the requirements for conducted emission.

Use the recommended filter and shielded motor cable. Observe the layout rules given in Figure 4-29. Ensure the AC supply and ground cables are at least 100mm from the power module and motor cable.

| Safety         Product         Mechanical         Electrical         Getting         Basic         Running         Optimization         SMARTCARD           Information         Installation         Installation         Started         paramters         the motor         Optimization         SMARTCARD | Onboard<br>PLC | ard Advanced<br>parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|----------------------------|-------------------|-------------|---------------------------|

Avoid placing sensitive signal circuits in a zone 300mm (12in) all around the power module.

### Figure 4-31 Sensitive signal circuit clearance

### Ensure good EMC grounding.

Figure 4-32 Grounding the drive, motor cable shield and filter

Connect the shield of the motor cable to the ground terminal of the motor frame using a link that is as short as possible and not exceeding 50mm (2in) long. A full 360° termination of the shield to the terminal housing of the motor is beneficial.

It is unimportant for EMC purposes whether the motor cable contains an internal (safety) ground core, or there is a separate external ground conductor, or grounding is through the shield alone. An internal ground core will carry a high noise current and therefore it must be terminated as close as possible to the shield termination.

### Figure 4-33 Grounding the motor cable shield

Unshielded wiring to the optional braking resistor(s) may be used, provided the wiring does not run external to the enclosure. Ensure a minimum spacing of 300mm (12in) from signal wiring and the AC supply wiring to the external EMC filter. Otherwise this wiring must be shielded.

| Safety         Product         Mechanical         Electrical         Getting         Basic         Running         Optimization           Information         Installation         Installation         Started         Started         paramters         The motor         Optimization | n SMARTCARD Onboard Advanced December of the parameters Data Diagnostics UL Listing Information |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|

If the control wiring is to leave the enclosure, it must be shielded and the shield(s) clamped to the drive using the grounding bracket as shown in Figure 4-35. Remove the outer insulating cover of the cable to ensure the shield(s) make contact with the bracket, but keep the shield(s) intact until as close as possible to the terminals

Alternatively, wiring may be passed through a ferrite ring.

Figure 4-35 Grounding of signal cable shields using the grounding bracket

# 4.11.6 Variations in the EMC wiring Interruptions to the motor cable

The motor cable should ideally be a single length of shielded or armored cable having no interruptions. In some situations it may be necessary to interrupt the cable, as in the following examples:

- Connecting the motor cable to a terminal block in the drive enclosure
- Installing a motor isolator / disconnect switch for safety when work is done on the motor

In these cases the following guidelines should be followed.

### Terminal block in the enclosure

The motor cable shields should be bonded to the back-plate using uninsulated metal cable-clamps which should be positioned as close as possible to the terminal block. Keep the length of power conductors to a minimum and ensure that all sensitive equipment and circuits are at least 0.3m (12 in) away from the terminal block.

Figure 4-36 Connecting the motor cable to a terminal block in the enclosure

### Using a motor isolator / disconnect-switch

The motor cable shields should be connected by a very short conductor having a low inductance. The use of a flat metal coupling-bar is recommended; conventional wire is not suitable.

The shields should be bonded directly to the coupling-bar using uninsulated metal cable-clamps. Keep the length of the exposed power conductors to a minimum and ensure that all sensitive equipment and circuits are at least 0.3m (12 in) away.

The coupling-bar may be grounded to a known low-impedance ground nearby, for example a large metallic structure which is connected closely to the drive ground.

## Figure 4-37 Connecting the motor cable to an isolator / disconnect switch

# Surge immunity of control circuits - long cables and connections outside a building

The input/output ports for the control circuits are designed for general use within machines and small systems without any special precautions.

These circuits meet the requirements of EN61000-6-2 (1kV surge) provided the 0V connection is not grounded.

In applications where they may be exposed to high-energy voltage surges, some special measures may be required to prevent malfunction or damage. Surges may be caused by lightning or severe power faults in association with grounding arrangements which permit high transient voltages between nominally grounded points. This is a particular risk where the circuits extend outside the protection of a building.

As a general rule, if the circuits are to pass outside the building where the drive is located, or if cable runs within a building exceed 30m, some additional precautions are advisable. One of the following techniques should be used:

- Galvanic isolation, i.e. do not connect the control 0V terminal to ground. Avoid loops in the control wiring, i.e. ensure every control wire is accompanied by its return (0V) wire.
- Shielded cable with additional power ground bonding. The cable shield may be connected to ground at both ends, but in addition the ground conductors at both ends of the cable must be bonded together by a power ground cable (equipotential bonding cable) with

| Sat    | fotv   | Product     | Mechanical   | Electrical   | Getting | Basic     | Runnina   |              | SMARTCARD | Onboard | Advanced   | Technical |             | UL Listina  |

|        |        |             |              |              |         |           |           |              | -         |         | -          |           |             |             |

cross-sectional area of at least 10mm<sup>2</sup>, or 10 times the area of the signal cable shield, or to suit the electrical safety requirements of the plant. This ensures that fault or surge current passes mainly through the ground cable and not in the signal cable shield. If the building or plant has a well-designed common bonded network this precaution is not necessary.

3. Additional over-voltage suppression - for the analog and digital inputs and outputs, a zener diode network or a commercially available surge suppressor may be connected in parallel with the input circuit as shown in Figure 4-38 and Figure 4-39.

If a digital port experiences a severe surge its protective trip may operate (O.Ld1 trip code 26). For continued operation after such an event, the trip can be reset automatically by setting Pr 10.34 to 5.

### Figure 4-38 Surge suppression for digital and unipolar inputs and outputs

Figure 4-39 Surge suppression for analog and bipolar inputs and outputs

Surge suppression devices are available as rail-mounting modules, e.g. from Phoenix Contact:

Unipolar TT-UKK5-D/24 DC Bipolar TT-UKK5-D/24 AC

These devices are not suitable for encoder signals or fast digital data networks because the capacitance of the diodes adversely affects the signal. Most encoders have galvanic isolation of the signal circuit from the motor frame, in which case no precautions are required. For data networks, follow the specific recommendations for the particular network.

#### 4.12 Serial communications connections

The drive has a serial communications port (serial port) as standard supporting 2 wire EIA485 communications. Please see Table 4-16 for the connection details for the RJ45 connector.

Table 4-16 Connection details for RJ45 connector

| Pin   | Function                                                      |  |  |  |  |  |  |  |
|-------|---------------------------------------------------------------|--|--|--|--|--|--|--|
| 1     | 120Ω Termination resistor                                     |  |  |  |  |  |  |  |
| 2     | RX TX                                                         |  |  |  |  |  |  |  |
| 3     | Isolated 0V                                                   |  |  |  |  |  |  |  |
| 4     | +24V (100mA)                                                  |  |  |  |  |  |  |  |
| 5     | Isolated 0V                                                   |  |  |  |  |  |  |  |
| 6     | TX enable                                                     |  |  |  |  |  |  |  |
| 7     | RX\ TX\                                                       |  |  |  |  |  |  |  |
| 8     | RX\TX\ (if termination resistors are required, link to pin 1) |  |  |  |  |  |  |  |
| Shell | Isolated 0V                                                   |  |  |  |  |  |  |  |

The communications port applies a 2 unit load to the communications network.

Minimum number of connections are 2, 3, 7 and shield. Shielded cable must be used at all times.

#### 4.12.1 Isolation of the serial communications port

The serial PC communications port is double insulated and meets the requirements for SELV in EN50178.

In order to meet the requirements for SELV in IEC60950 (IT equipment) it is necessary for the control computer to be grounded. Alternatively, when a lap-top or similar device is used which has no provision for grounding, an isolation WARNING device must be incorporated in the communications lead.

An isolated serial communications lead has been designed to connect the drive to IT equipment (such as lap-top computers), and is available from the supplier of the drive. See below for details:

### Table 4-17 Isolated serial comms lead details

### Description

EIA232 Comms cable

**USB** Comms cable

The "isolated serial communications" lead has reinforced insulation as defined in IEC60950 for altitudes up to 3,000m.

|--|-----------------------|------------------------|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

### NOTE

When using the EIA232 Comms cable the available baud rate is limited to 19.2k baud.

### 4.12.2 Multi-drop network

The drive can be used on a 2 wire EIA485 multi-drop network using the drive's serial communications port when the following guidelines are adhered to.

### Connections

The network should be a daisy chain arrangement and not a star, although short stubs to the drive are allowed.

The minimum connections are pins 2 (RX TX), 3 (isolated 0V), 7 (RX\ TX\) and the shield.

Pin 4 (+24V) on each drive can be connected together but there is no power sharing mechanism between drives and therefore the maximum power available is the same as a single drive. (If pin 4 is not linked to the other drives on the network and has an individual load then the maximum power can be taken from pin 4 of each drive.)

### **Termination resistors**

If a drive is on the end of the network chain then pins 1 and 8 should be linked together. This will connect an internal  $120\Omega$  termination resistor between RXTX and RX\TX\. (If the end unit is not a drive or the user wishes to use their own termination resistor, a  $120\Omega$  termination resistor should be connected between RXTX and RX\TX\ at the end unit.)

If the host is connected to a single drive then termination resistors should not be used unless the baud rate is high.

### **Comms Cable**

The Comms Cable can be used on a multi-drop network but should only be used occasionally for diagnostic and set up purposes. The network must also be made up entirely of Unidrive SPs.

If the Comms Cable is to be used, then pin 6 (TX enable) should be connected on all drives and pin 4 (+24V) should be linked to at least 1 drive to supply power to the converter in the cable.

Only one Comms Cable can be used on a network.

### 4.12.3 Multi-drop network

The drive can be used on a 2 wire EIA485 multi-drop network using the drive's serial communications port when the following guidelines are adhered to.

### Connections

The network should be a daisy chain arrangement and not a star, although short stubs to the drive are allowed.

The minimum connections are pins 2 (RX TX), 3 (isolated 0V), 7 (RX\ TX\) and the shield.

Pin 4 (+24V) on each drive can be connected together but there is no power sharing mechanism between drives and therefore the maximum power available is the same as a single drive. (If pin 4 is not linked to the other drives on the network and has an individual load then the maximum power can be taken from pin 4 of each drive.)

### **Termination resistors**

If a drive is on the end of the network chain then pins 1 and 8 should be linked together. This will connect an internal  $120\Omega$  termination resistor between RXTX and RX\TX\. (If the end unit is not a drive or the user wishes to use their own termination resistor, a  $120\Omega$  termination resistor should be connected between RXTX and RX\TX\ at the end unit.)

If the host is connected to a single drive then termination resistors should not be used unless the baud rate is high.

### **Comms Cable**

The Comms Cable can be used on a multi-drop network but should only be used occasionally for diagnostic and set up purposes. The network must also be made up entirely of Unidrive SPs.

If the Comms Cable is to be used, then pin 6 (TX enable) should be connected on all drives and pin 4 (+24V) should be linked to at least 1 drive to supply power to the converter in the cable.

Only one Comms Cable can be used on a network.

## 4.13 Control connections

### 4.13.1 General

Table 4-18 The control connections consist of:

| Function                                              | Qty | Control parameters available                                                 | Terminal<br>number      |
|-------------------------------------------------------|-----|------------------------------------------------------------------------------|-------------------------|
| Differential analog input                             | 1   | Destination, offset, offset trim, invert, scaling                            | 5,6                     |
| Single ended analog<br>input                          | 2   | Mode, offset, scaling, invert, destination                                   | 7,8                     |
| Analog output                                         | 2   | Source, mode, scaling,                                                       | 9,10                    |
| Digital input                                         | 3   | Destination, invert, logic select                                            | 27, 28, 29              |
| Digital input / output                                | 3   | Input / output mode select,<br>destination / source, invert,<br>logic select | 24, 25, 26              |
| Relay                                                 | 1   | Source, invert                                                               | 41,42                   |
| Drive enable (SAFE<br>TORQUE OFF (SECURE<br>DISABLE)) | 1   |                                                                              | 31                      |
| +10V User output                                      | 1   |                                                                              | 4                       |
| +24V User output                                      | 1   | Source, invert                                                               | 22                      |
| 0V common                                             | 6   |                                                                              | 1, 3, 11, 21,<br>23, 30 |
| +24V External input                                   | 1   |                                                                              | 2                       |

#### Key:

| Destination<br>parameter: | indicates the parameter which is being controlled by the terminal / function                      |
|---------------------------|---------------------------------------------------------------------------------------------------|
| Source<br>parameter:      | indicates the parameter being output by the terminal                                              |
| Mode<br>parameter:        | analog - indicates the mode of operation of the terminal, i.e. voltage 0-10V, current 4-20mA etc. |
|                           | digital - indicates the mode of operation of the terminal,                                        |

digital - indicates the mode of operation of the terminal, i.e. positive / negative logic (the Drive Enable terminal is fixed in positive logic), open collector.

All analog terminal functions can be programmed in menu 7.

All digital terminal functions (including the relay) can be programmed in menu 8.

The setting of Pr **1.14** and Pr **6.04** can cause the function of digital inputs T25 to T29 to change. For more information, please refer to section 11.21.1 *Reference modes* on page 249and section 11.21.7 *Start / stop logic modes* on page 254.

The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply voltage.

If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

If any of the digital inputs or outputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

Ensure the logic sense is correct for the control circuit to be used. Incorrect logic sense could cause the motor to be started unexpectedly.

Positive logic is the default state for Unidrive SP.

|-----------------------|------------------------|----------------------------|----------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

### NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

### NOTE

The SAFE TORQUE OFF (SECURE DISABLE) / drive enable terminal is a positive logic input only. It is not affected by the setting of Pr 8.29 Positive logic select.

### NOTE

The common 0V from analog signals should, wherever possible, not be connected to the same 0V terminal as the common 0V from digital signals. Terminals 3 and 11 should be used for connecting the 0V common of analog signals and terminals 21, 23 and 30 for digital signals. This is to prevent small voltage drops in the terminal connections causing inaccuracies in the analog signals.

#### Figure 4-41 Default terminal functions

\* With software V01.07.00 and later, Analog input 3 is configured as a motor thermistor input. With software V01.06.02 and earlier, Analog input 3 has no default function. Refer to Analog input 3 on page 87.

\*\*The SAFE TORQUE OFF (SECURE DISABLE) / Drive enable terminal is a positive logic input only.

| The drive enable terminal (T31) provides a SAFE TORQUE OFF<br>(SECURE DISABLE) function. The SAFE TORQUE OFF (SECURE<br>DISABLE) function meets the requirements of EN954-1 category 3 for<br>the prevention of unexpected starting of the drive. It may be used in a<br>safety-related application in preventing the drive from generating<br>torque in the motor to a high level of integrity. |                                   |  |  |  |  |

Refer to section 4.16 SAFE TORQUE OFF (SECURE DISABLE) on page 93 for further information.

A fuse or other over-current protection should be installed to the relay circuit.

## 4.14 Encoder connections

### 4.14.1 Location of encoder connector (size 0)

Before using the encoder connector on size 0 for the first time, the break-out need removing as shown in Figure 4-42.

Figure 4-42 Access to encoder connections

After removing the break-out, ensure that the ground tab is connected to ground. This will connect 0V of the drive to ground. This is required to enable the drive to meet IP20 when the break-out is removed.

### NOTE

Do not remove the break-out if the encoder connection is not required.

Figure 4-44 Connecting the encoder ground tab to the EMC bracket

### NOTE

The size of the connecting cable between the encoder ground tab and the EMC bracket should be equal to the input cable.

\* This feedback device provides very low resolution feedback and should not be used for applications requiring a high level of performance

\*\* The U, V & W commutation signals are required with an incremental type encoder when used with a servo motor. The UVW commutation signals are used to define the motor position during the first 120° electrical rotation after the drive is powered-up or the encoder is initialized.

servo motor, a large speed feedback filter (Pr **3.42**) is required due to the time taken for the position information to be transferred from the encoder into the drive. The addition of this filter means that SSI only encoders are not suitable for speed feedback in dynamic or high-speed applications.

|       | um applied differential voltage | ±4V                                                                          |  |  |  |  |

For the SinCos encoder to be compatible with Unidrive SP, the output signals from the encoder must be a 1V peak to peak differential voltage (across Sin to Sinref and Cos to Cosref).

The majority of encoders have a DC offset on all signals. Stegmann encoders typically have a 2.5Vdc offset. The Sinref and Cosref are a flat DC level at 2.5Vdc and the Cos and Sin signals have a 1V peak to peak waveform biased at 2.5Vdc.

Encoders are available which have a 1V peak to peak voltage on Sin, Sinref, Cos and Cosref. This results in a 2V peak to peak voltage seen at the drive's encoder terminals. It is not recommended that encoders of this type are used with Unidrive SP, and that the encoder feedback signals should meet the above parameters (1V peak to peak).

**Resolution:** The sinewave frequency can be up to 500kHz but the resolution is reduced at high frequency. Table 4-21 shows the number of bits of interpolated information at different frequencies and with different voltage levels at the drive encoder port. The total resolution in bits per revolution is the ELPR plus the number of bits of interpolated information. Although it is possible to obtain 11 bits of interpolation information, the nominal design value is 10 bits.

Not used with EndAt and SSI communications only encoders.

 Table 4-21
 Feedback resolution based on frequency and voltage level

|           |      |      |       | -      | -      | -      |

### Common to all Encoder types

| 13 Encoder supply voltage |                                                 |
|---------------------------|-------------------------------------------------|
| Supply voltage            | 5.15V $\pm 2\%$ , 8V $\pm 5\%$ or 15V $\pm 5\%$ |
| Maximum output current    | 300mA for 5V and 8V<br>200mA for 15V            |

The voltage on terminal 13 is controlled by Pr 3.36. The default for this parameter is 5V (0) but this can be set to 8V (1) or 15V (2). Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device.

The termination resistors should be disabled if the outputs from the encoder are higher than 5V.

### 14 0V common

### 15 Motor thermistor input

This terminal is connected internally to terminal 8 of the signal connector. Connect only one of these terminals to a motor thermistor. Analog input 3 must be in thermistor mode, Pr **7.15** = th.SC (7), th (8) or th.diSP (9).

## 4.15 Low voltage DC mode enable and heatsink fan supply connections (size 4 to 6)

Sizes 4 to 6 require a 24V enable signal to terminal 50 and 51 of the lower terminal connector near the W phase output, to allow the drive to be used from a low voltage DC supply.

For more information regarding low voltage DC operation, see the *Low Voltage DC Mode Installation Guide*.

## 4.16 SAFE TORQUE OFF (SECURE DISABLE)

The SAFE TORQUE OFF (SECURE DISABLE) function provides a means for preventing the drive from generating torque in the motor, with a very high level of integrity. It is suitable for incorporation into a safety system for a machine. It is also suitable for use as a conventional drive enable input.

The SAFE TORQUE OFF (SECURE DISABLE) function makes use of the special property of an inverter drive with an induction motor, which is that torque cannot be generated without the continuous correct active behaviour of the inverter circuit. All credible faults in the inverter power circuit cause a loss of torque generation. The SAFE TORQUE OFF (SECURE DISABLE) function is fail-safe, so when the SAFE TORQUE OFF (SECURE DISABLE) input is

disconnected the drive will not operate the motor, even if a combination of components within the drive has failed. Most component failures are revealed by the drive failing to operate. SAFE TORQUE OFF (SECURE DISABLE) is also independent of the drive firmware. This meets the requirements of EN954-1 category 3 for the prevention of operation of

the motor.<sup>1</sup> On drives with date code P04 and later the SAFE TORQUE OFF (SECURE DISABLE) input also meets the requirements of EN 81-1 clause 12.7.3 b) as part of a system for preventing unwanted operation of the motor in a lift (elevator).<sup>2</sup>

<sup>1</sup> Independent approval has been given by BGIA.

<sup>2</sup> Independent approval of concept has been given by TÜV. Please consult the separate guide for lift applications for further information.

SAFE TORQUE OFF (SECURE DISABLE) can be used to eliminate electro-mechanical contactors, including special safety contactors, which would otherwise be required for safety applications.

# Note on response time of SAFE TORQUE OFF (SECURE DISABLE), and use with safety controllers with self-testing outputs (drives with date code P04 and later).

SAFE TORQUE OFF (SECURE DISABLE) has been designed to have a response time of greater than 1ms, so that it is compatible with safety controllers whose outputs are subject to a dynamic test with a pulse width not exceeding 1ms.

For applications where a fast-acting disable function is required, please see section 11.21.10 *Fast Disable* on page 257

# Note on the use of servo motors, other permanent-magnet motors, reluctance motors and salient-pole induction motors

When the drive is disabled through SAFE TORQUE OFF (SECURE DISABLE), a possible (although highly unlikely) failure mode is for two power devices in the inverter circuit to conduct incorrectly.

This fault cannot produce a steady rotating torque in any AC motor. It produces no torque in a conventional induction motor with a cage rotor. If the rotor has permanent magnets and/or saliency, then a transient alignment torque may occur. The motor may briefly try to rotate by up to 180° electrical, for a permanent magnet motor, or 90° electrical, for a salient pole induction motor or reluctance motor. This possible failure mode must be allowed for in the machine design.

The design of safety-related control systems must only be done by personnel with the required training and experience.

The SAFE TORQUE OFF (SECURE DISABLE) function will only ensure the safety of a machine if it is correctly incorporated into a complete safety system. The system must be subject to a risk assessment to confirm that the residual risk of an unsafe event is at an acceptable level for the application.

To maintain category 3 according to EN954-1 the environment limits given in section 12.1 *Drive technical data* on page 258 must be adhered to.

SAFE TORQUE OFF (SECURE DISABLE) inhibits the operation of the drive, this includes inhibiting braking. If the drive is required to provide both braking and SAFE TORQUE OFF (SECURE DISABLE) in the same operation (e.g. for emergency stop) then a safety timer relay or similar device must be used to ensure that the drive is disabled a suitable time offer braking. The braking function is the drive

device must be used to ensure that the drive is disabled a suitable time after braking. The braking function in the drive is provided by an electronic circuit which is not fail-safe. If braking is a safety requirement, it must be supplemented by an independent fail-safe braking mechanism.

|-----------------------|------------------------|----------------------------|-------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|-----------------------|------------------------|----------------------------|-------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

SAFE TORQUE OFF (SECURE DISABLE) does not provide electrical isolation. The supply to the drive must be disconnected by an approved isolation device before gaining warning access to power connections.

The following diagrams illustrate how the SAFE TORQUE OFF (SECURE DISABLE) input can be used to eliminate contactors and safety contactors from control systems. Please note these are provided for illustration only, every specific arrangement must be verified for suitability in the proposed application.

In the first example, illustrated in Figure 4-49, the SAFE TORQUE OFF (SECURE DISABLE) function is used to replace a simple power contactor in applications where the risk of injury from unexpected starting is small, but it is not acceptable to rely on the complex hardware and firmware/software used by the stop/start function within the drive.

Figure 4-49 Start / stop control EN954-1 category B - replacement of contactor

In the second example, illustrated in Figure 4-50 and Figure 4-51, a conventional high-integrity system which uses two safety contactors with auxiliary contacts with connected movement is replaced by a single SAFE TORQUE OFF (SECURE DISABLE) system. This arrangement meets EN954-1 category 3.

Figure 4-50 Category 3 interlock using electromechanical safety contactors

The safety function of the example circuit is to ensure that the motor does not operate when the interlocks are not signalling a safe state. The safety relay is used to check the two interlock channels and detect faults in those channels. The stop/start buttons are shown for completeness as part of a typical arrangement, they do not carry out a safety function and are not necessary for the safe operation of the circuit.

In the conventional system, a contactor failure in the unsafe direction is detected the next time the safety relay is reset. Since the drive is not part of the safety system it has to be assumed that AC power is always available to drive the motor, so two contactors in series are required in order to prevent the first failure from causing an unsafe event (i.e. the motor driven).

With SAFE TORQUE OFF (SECURE DISABLE) there are no single faults in the drive which can permit the motor to be driven. Therefore it is not necessary to have a second channel to interrupt the power connection, nor a fault detection circuit.

It is important to note that a single short-circuit from the Enable input (SAFE TORQUE OFF (SECURE DISABLE)) to a DC supply of approximately +24V would cause the drive to be enabled. For this reason, Figure 4-51 shows the wire from the Enable input to the safety relay as "protected wiring" so that the possibility of a short circuit from this wire to the DC supply can be excluded, as specified in ISO 13849-2. The wiring can be protected by placing it in a segregated cable duct or other enclosure, or by providing it with a grounded shield. The shield is provided to avoid a hazard from an electrical fault. It may be grounded by any convenient method, no special EMC precautions are required.

If the use of protected wiring is not acceptable, so that the possibility of this short circuit must be allowed for, then a relay must be used to monitor the state of the Enable input, together with a single safety contactor to prevent operation of the motor after a fault. This is illustrated in Figure 4-52.

| Safety<br>Information | Product<br>Information | Mechanical<br>Installation | Electrical Installation | Getting<br>Started | Basic<br>paramters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |

|-----------------------|------------------------|----------------------------|-------------------------|--------------------|--------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

### NOTE

The auxiliary relay K2 must be located in the same enclosure and close to the drive, with its coil connected as closely as possible to the drive enable / SAFE TORQUE OFF (SECURE DISABLE) input.

## 5 Getting Started

This chapter introduces the user interfaces, menu structure and security level of the drive.

## 5.1 Understanding the display

There are two types of keypad available for the Unidrive SP, LED and LCD. The SM-Keypad and SP0 Keypad have an LED display, and the SM-Keypad Plus has an LCD display. The SP0 Keypad can only be fitted to size 0, and the SM-Keypad can only be fitted to size 1 to 6. The SM-Keypad Plus can either be fitted to the size 1 to 6, or it can be remotely mounted on an enclosure door.

### 5.1.1 SM-Keypad/SP0 Keypad (LED)

The display consists of two horizontal rows of 7 segment LED displays.

The upper display shows the drive status or the current menu and parameter number being viewed.

The lower display shows the parameter value or the specific trip type.

### Figure 5-1 SM-Keypad

### Figure 5-3 SP0 Keypad

## 5.1.2 SM-Keypad Plus (LCD)

The display consists of three lines of text.

The top line shows the drive status or the current menu and parameter number being viewed on the left, and the parameter value or the specific trip type on the right.

The lower two lines show the parameter name or the help text.

### Figure 5-2 SM-Keypad Plus

NOTE

The red stop 💿 button is also used to reset the drive.

The SM-Keypad/SP0 Keypad and the SM-Keypad Plus can indicate when a SMARTCARD access is taking place or when the second motor map is active (menu 21). These are indicated on the displays as follows.

|                               | SM-Keypad / SP0 Keypad                                                    | SM-Keypad Plus                                                              |
|-------------------------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| SMARTCARD access taking place | The decimal point after the fourth digit in the upper display will flash. | The symbol 'CC' will appear in the lower left<br>hand corner of the display |
| Second motor map active       | The decimal point after the third digit in the upper display will flash.  | The symbol 'Mot2' will appear in the lower left hand corner of the display  |

## 5.2 Keypad operation

### 5.2.1 Control buttons

The keypad consists of:

- 1. Joypad used to navigate the parameter structure and change parameter values.
- 2. Mode button used to change between the display modes parameter view, parameter edit, status.
- 3. Three control buttons used to control the drive if keypad mode is selected.
- 4. Help button (SM-Keypad Plus only) displays text briefly describing the selected parameter.

The Help button toggles between other display modes and parameter help mode. The up and down functions on the joypad scroll the help text to allow the whole string to be viewed. The right and left functions on the joypad have no function when help text is being viewed.

The display examples in this section show the SM-Keypad 7 segment LED display. The examples are the same for the SM-Keypad Plus except that the information displayed on the lower row on the SM-Keypad is displayed on the right hand side of the top row on the SM-Keypad Plus.

\* can only be used to move between menus if L2 access has been enabled (Pr **0.49**). Refer to section 5.9 on page 101. \*\*Timeout defined by Pr **11.41** (default value = 240s).

Do not change parameter values without careful consideration; incorrect values may cause damage or a safety hazard.

NOTE

When changing the values of parameters, make a note of the new values in case they need to be entered again.

### NOTE

For new parameter-values to apply after the AC supply to the drive is interrupted, new values must be saved. Refer to section 5.7 *Saving parameters* on page 100.

## 5.3 Menu structure

The drive parameter structure consists of menus and parameters.

The drive initially powers up so that only menu 0 can be viewed. The up and down arrow buttons are used to navigate between parameters and once level 2 access (L2) has been enabled (see Pr **0.49**) the left and right buttons are used to navigate between menus. For further information, refer to section 5.9 *Parameter access level and security* on page 101.

### Figure 5-6 Parameter navigation

\* can only be used to move between menus if L2 access has been enabled (Pr **0.49**). Refer to section 5.9 *Parameter access level and security* on page 101.

The menus and parameters roll over in both directions.

i.e. if the last parameter is displayed, a further press will cause the display to rollover and show the first parameter.

When changing between menus the drive remembers which parameter was last viewed in a particular menu and thus displays that parameter.

Figure 5-7 Menu structure

## 5.4 Menu 0

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive.

Appropriate parameters are copied from the advanced menus into menu 0 and thus exist in both locations.

For further information, refer to Chapter 6 *Basic parameters* on page 104.

## 5.5 Advanced menus

The advanced menus consist of groups or parameters appropriate to a specific function or feature of the drive. Menus 0 to 22 can be viewed on all keypads. Menus 40 and 41 are specific to the SM-Keypad Plus (LCD). Menus 70 to 91 can be viewed with an SM-Keypad Plus (LCD) only when an SM-Applications is installed.

### Table 5-1 Advanced menu descriptions

| Menu          | Description                                                        | LED | LCD |
|---------------|--------------------------------------------------------------------|-----|-----|
| 0             | Commonly used basic set up parameters for quick / easy programming | ~   | ~   |
| 1             | Frequency / speed reference                                        | ✓   | ✓   |
| 2             | Ramps                                                              | ✓   | ✓   |

### 5.5.2 Display messages

The following tables indicate the various possible mnemonics which can be displayed by the drive and their meaning.

Trip types are not listed here but can be found in Chapter 6 *Basic parameters* on page 104 if required.

|                                | C program is installed and running. The lower display once every 10s.                                                               |

### Table 5-5 Solutions Module and SMARTCARD status indications on power-up

| Lower<br>display | Description                                              |
|------------------|----------------------------------------------------------|
| boot             |                                                          |
|                  | t is being transferred from the SMARTCARD to the         |
| drive during por | wer-up. For further information, please refer to section |
| 9.2.4 Booting u  | p from the SMARTCARD on every power up (Pr 11.42 =       |
| boot (4)) on pag | ge 145.                                                  |
| cArd             |                                                          |

#### C

The drive is writing a parameter set to the SMARTCARD during powerup.

For further information, please refer to section 9.2.3 Auto saving parameter changes (Pr 11.42 = Auto (3)) on page 145.

loAding

The drive is writing information to a Solutions Module.

## 5.6 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. (Pr **0.49** *Security status* and Pr **0.34** *User security code* are not affected by this procedure.)

### Procedure

Use the following procedure only if a different operating mode is required:

- 1. Ensure the drive is not enabled, i.e. terminal 31 is open or Pr 6.15 is Off (0)
- Enter either of the following values in Pr xx.00, as appropriate: 1253 (EUR, 50Hz AC supply frequency) 1254 (USA, 60Hz AC supply frequency)
- 3. Change the setting of Pr 0.48 as follows:

| Pr 0.48 setting |   | Operating mode                                                                                               |
|-----------------|---|--------------------------------------------------------------------------------------------------------------|
| 048<br>026n 12  | 1 | Open-loop                                                                                                    |
| С. UECE         | 2 | Closed-loop vector                                                                                           |
| 0,48<br>567-00  | 3 | Closed-loop Servo                                                                                            |
| 048<br>FESEn    | 4 | Regen (See the Unidrive SP Regen<br>Installation Guide for more information<br>about operating in this mode) |

The figures in the second column apply when serial communications are used.

- 4. Either:
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

### NOTE

Entering 1253 or 1254 in Pr **xx.00** will only load defaults if the setting of Pr **0.48** has been changed.

## 5.7 Saving parameters

When changing a parameter in Menu 0, the new value is saved when pressing the *M* Mode button to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out.

#### Procedure Enter 1000\* in Pr. xx.00

Enter 10

Either:

- Press the red 
   reset button
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

\*If the drive is in the under voltage trip state or is being supplied from a low voltage DC supply, a value of 1001 must be entered into Pr **xx.00** to perform a save function.

## 5.8 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drive's memory. (Pr **0.49** and Pr **0.34** are not affected by this procedure.)

### Procedure

- 1. Ensure the drive is not enabled, i.e. terminal 31 is open or Pr 6.15 is Off (0)
- 2. Enter 1233 (EUR 50Hz settings) or 1244 (USA 60Hz settings) in Pr xx.00.

| Safety Product Mechanical Electrica<br>Information Information Installation Installation | Getting Basic<br>Started parameters | Running<br>the motor Optimiza | tion SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |
|------------------------------------------------------------------------------------------|-------------------------------------|-------------------------------|--------------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|------------------------------------------------------------------------------------------|-------------------------------------|-------------------------------|--------------------------|----------------|---------------------|-------------------|-------------|---------------------------|

- 3. Either:
- Press the red 
   reset button
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr **10.38** to 100 (ensure that Pr. **xx.00** returns to 0).

## 5.9 Parameter access level and security

The parameter access level determines whether the user has access to menu 0 only or to all the advanced menus (menus 1 to 22) in addition to menu 0.

The User Security determines whether the access to the user is read only or read write.

Both the User Security and Parameter Access Level can operate independently of each other as shown in the table below:

| Parameter<br>Access Level | User Security | Menu 0<br>status | Advanced<br>menus status |
|---------------------------|---------------|------------------|--------------------------|
| L1                        | Open          | RW               | Not visible              |
| L1                        | Closed        | RO               | Not visible              |
| L2                        | Open          | RW               | RW                       |
| L2                        | Closed        | RO               | RO                       |

RW = Read / write access RO = Read only access

The default settings of the drive are Parameter Access Level L1 and user Security Open, i.e. read / write access to Menu 0 with the advanced menus not visible.

### 5.9.1 Access Level

The access level is set in Pr **0.49** and allows or prevents access to the advanced menu parameters.

L1 access selected - Menu 0 only visible

### L2 access selected - All parameters visible

| Pr 0.00 | Pr 1.00 | <br>Pr 21.00 | Pr 22.00 |
|---------|---------|--------------|----------|
| Pr 0.01 | Pr 1.01 | <br>Pr 21.01 | Pr 22.01 |
| Pr 0.02 | Pr 1.02 | <br>Pr 21.02 | Pr 22.02 |
| Pr 0.03 | Pr 1.03 | <br>Pr 21.03 | Pr 22.03 |
|         |         |              |          |
|         |         |              |          |
| Pr 0.49 | Pr 1.49 | <br>Pr 21.30 | Pr 22.28 |
| Pr 0.50 | Pr 1.50 | <br>Pr 21.31 | Pr 22.29 |

### 5.9.2 Changing the Access Level

The Access Level is determined by the setting of Pr 0.49 as follows:

| String | Value | Effect                                  |
|--------|-------|-----------------------------------------|
| L1     | 0     | Access to menu 0 only                   |
| L2     | 1     | Access to all menus (menu 0 to menu 22) |

The Access Level can be changed through the keypad even if the User Security has been set.

### 5.9.3 User Security

The User Security, when set, prevents write access to any of the parameters (other than Pr. **0.49** and Pr **11.44** *Access Level*) in any menu.

User security open - All parameters: Read / Write access

### User security closed - All parameters: Read Only access (except Pr 0.49 and Pr 11.44)

|           |           | 、 i |          | ,         |
|-----------|-----------|-----|----------|-----------|
| Pr 0.00   | Pr 1.00   |     | Pr 21.00 | Pr 22.00  |
| Pr 0.01 / | / Pr 1.01 | /.  | Pr 21.01 | Pr 22.01  |
| Pr 0.02   | Pr 1.02   | //  | Pr 21.02 | Pr 22.02  |
| Pr 0.0⁄3/ | Pr 1.03   |     | Pr 21.03 | Pr 22.03  |
| /         |           | //  |          |           |
|           |           |     |          | V/        |
| Pr 0.49   | Pr 1.49   | /   | Pr 21.30 | /Pr 22.28 |
| Pr 0.50   | Pr 1.50   |     | Pr 21.31 | Pr 22.29  |

### **Setting User Security**

Enter a value between 1 and 999 in Pr **0.34** and press the **W** button; the security code has now been set to this value. In order to activate the security, the Access level must be set to Loc in Pr **0.49**. When the drive is reset, the security code will have been activated and the drive returns to Access Level L1. The value of Pr **0.34** will return to 0 in order to hide the security code. At this point, the only parameter that can be changed by the user is the Access Level Pr **0.49**.

### **Unlocking User Security**

Select a read write parameter to be edited and press the *w* button, the upper display will now show CodE. Use the arrow buttons to set the

security code and press the M button.

With the correct security code entered, the display will revert to the parameter selected in edit mode.

If an incorrect security code is entered the display will revert to parameter view mode.

To lock the User Security again, set  $\Pr{0.49}$  to Loc and press the  $\textcircled{\sc opt}$  reset button.

| Safety    | Product        | Mechanical   | Electrical   | Getting | Basic      | Running   | Ontimization | SMARTCARD | Onboard | Advanced   | Technical | Diagnostics | UL Listing  |
|-----------|----------------|--------------|--------------|---------|------------|-----------|--------------|-----------|---------|------------|-----------|-------------|-------------|
| Informati | on Information | Installation | Installation | Started | parameters | the motor | Optimization | operation | PLC     | parameters | Data      | Diagnostics | Information |

### **Disabling User Security**

Unlock the previously set security code as detailed above. Set Pr 0.34 to

0 and press the 🚺 button. The User Security has now been disabled, and will not have to be unlocked each time the drive is powered up to allow read / write access to the parameters.

## 5.10 Displaying parameters with nondefault values only

By entering 12000 in Pr **xx.00**, the only parameters that will be visible to the user will be those containing a non-default value. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **xx.00** and enter a value of 0.

Please note that this function can be affected by the access level enabled, refer to section 5.9 Parameter access level and security for further information regarding access level.

## 5.11 Displaying destination parameters only

By entering 12001 in Pr **xx.00**, the only parameters that will be visible to the user will be destination parameters. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **xx.00** and enter a value of 0.

Please note that this function can be affected by the access level enabled, refer to *section 5.9 Parameter access level and security* for further information regarding access level.

## 5.12 Serial communications

### 5.12.1 Introduction

The Unidrive SP has a standard 2-wire EIA485 interface (serial communications interface) which enables all drive set-up, operation and monitoring to be carried out with a PC or controller if required. Therefore, it is possible to control the drive entirely by serial communications without the need for a SM-keypad or other control cabling. The drive supports two protocols selected by parameter configuration:

- Modbus RTU
- ANSI

Modbus RTU has been set as the default protocol, as it is used with the PC-tools commissioning/start-up software as provided on the CD ROM.

The serial communications port of the drive is a RJ45 socket, which is isolated from the power stage and the other control terminals (see section 4.12 *Serial communications connections* on page 84 for connection and isolation details).

The communications port applies a 2 unit load to the communications network.

### USB/EIA232 to EIA485 Communications

An external USB/EIA232 hardware interface such as a PC cannot be used directly with the 2-wire EIA485 interface of the drive. Therefore a suitable converter is required.

Suitable USB to EIA485 and EIA232 to EIA485 isolated converters are available from EPA as follows:

- USB Comms cable
- EIA232 Comms cable

When using one of the above converters or any other suitable converter with the Unidrive SP, it is recommended that no terminating resistors be connected on the network. It may be necessary to 'link out' the terminating resistor within the converter depending on which type is used. The information on how to link out the terminating resistor will normally be contained in the user information supplied with the converter.

## 5.12.2 Serial communications set-up parameters

The following parameters need to be set according to the system requirements.

| 0.35 | 0.35 {11.24}<br>RW Txt |     | Serial           | mode |   |  |        |    |  |
|------|------------------------|-----|------------------|------|---|--|--------|----|--|
| RW   | ' '                    | Txt |                  |      |   |  |        | US |  |
| €    |                        |     | AnSI (<br>rtU (1 | · ·  | ₽ |  | rtU (1 | )  |  |

This parameter defines the communications protocol used by the 485 comms port on the drive. This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original protocol. The master should wait at least 20ms before send a new message using the new protocol. (Note: ANSI uses 7 data bits, 1 stop bit and even parity; Modbus RTU uses 8 data bits, 2 stops bits and no parity.)

| Comms value | String | Communications mode                                      |
|-------------|--------|----------------------------------------------------------|
| 0           | AnSI   | ANSI                                                     |
| 1           | rtU    | Modbus RTU protocol                                      |
| 2           | Lcd    | Modbus RTU protocol, but with an SM-<br>Keypad Plus only |

### ANSIx3.28 protocol

Full details of the ANSI communications protocol are the Advanced User Guide.

### Modbus RTU protocol

Full details of the implementation of Modbus RTU are given in the *Advanced User Guide*.

### Modbus RTU protocol, but with an SM-Keypad Plus only

This setting is used for disabling communications access when the SM-SM-Keypad Plus is used as a hardware key. See the *Advanced User Guide* for more details.

| 0.3 | 36 {1 | 1.25}                                  | Serial             | comm               | unicati       | ions | s ba | ud rate | e     |     |  |
|-----|-------|----------------------------------------|--------------------|--------------------|---------------|------|------|---------|-------|-----|--|
| R   | W     | Txt                                    |                    |                    |               |      |      |         |       | US  |  |
| ≎   |       | 300 (0),<br>400 (3),<br>1920(<br>57600 | 4800 (<br>0 (6), 3 | 4), 960<br>8400 (7 | 0 (5),<br>7), | 分    |      |         | 19200 | (6) |  |

\* only applicable to Modbus RTU mode

This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20ms before sending a new message using the new baud rate.

### NOTE

When using the EIA232 Comms cable the available baud rate is limited to 19.2k baud.

| 0.3                | 0.37 {11.23} Serial communications address |     |  |  |  |  |  |  |   |    |  |
|--------------------|--------------------------------------------|-----|--|--|--|--|--|--|---|----|--|
| R۱                 | N                                          | Txt |  |  |  |  |  |  |   | US |  |
| $\hat{\mathbb{V}}$ | ¢ 0 to 247                                 |     |  |  |  |  |  |  | 1 |    |  |

Used to define the unique address for the drive for the serial interface. The drive is always a slave.

### Modbus RTU

When the Modbus RTU protocol is used addresses between 0 and 247 are permitted. Address 0 is used to globally address all slaves, and so this address should not be set in this parameter

### ANSI

When the ANSI protocol is used the first digit is the group and the second digit is the address within a group. The maximum permitted group number is 9 and the maximum permitted address within a group is

| Safety<br>InformationProduct<br>InstallationMechanical<br>InstallationElectrical<br>InstallationGetting<br>StartedBasic<br>parametersRunning<br>the motorOptimizationSMARTCARD<br>operationOnboard<br>PLCAdvanced<br>parametersTechnical<br>Data | Nostics UL Listing<br>Information |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|

9. Therefore, Pr 0.37 is limited to 99 in this mode. The value 00 is used to globally address all slaves on the system, and x0 is used to address all slaves of group x, therefore these addresses should not be set in this parameter.

| Safety<br>Information | Product<br>Information | Mechanical<br>Installation | Electrical<br>Installation | Getting<br>Started | Basic<br>parameters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |

## 6 Basic parameters

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. All the parameters in menu 0 appear in other menus in the drive (denoted by {...}).

Menus 11 and 22 can be used to change most of the parameters in menu 0. Menu 0 can also contain up to 59 parameters by setting up menu 22.

## 6.1 Single line descriptions

| Txt    | Text: the parameter uses text strings instead of numbers.                                                                          |
| FI     | Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing. |
| DE     | Destination: This parameter selects the destination of an input or logic function.                                                 |

| Coding | Attribute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RA     | Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will not be transferred to the destination drive by SMARTCARDs when the rating of the destination drive is different from the source drive and the file is a parameter file. However, with software V01.09.00 and later the value will be transferred if only the current rating is different and the file is a differences from default type file. |
| NC     | Not copied: not transferred to or from SMARTCARDs during copying.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PT     | Protected: cannot be used as a destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| US     | User save: parameter saved in drive EEPROM when the user initiates a parameter save.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PS     | Power-down save: parameter automatically saved in drive<br>EEPROM when the under volts (UV) trip occurs. With<br>software version V01.08.00 and later, power-down save<br>parameters are also saved in the drive when the user<br>initiates a parameter save.                                                                                                                                                                                                                                                           |

## 6.2 Full descriptions

### 6.2.1 Parameter x.00

| 0.00 {x.00} Parameter zero |             |  |  |  |  |  |  |  |   |  |  |
|----------------------------|-------------|--|--|--|--|--|--|--|---|--|--|
| R۱                         | RW Uni      |  |  |  |  |  |  |  |   |  |  |
| ţ                          | û to 32,767 |  |  |  |  |  |  |  | 0 |  |  |

Pr x.00 is available in all menus and has the following functions.

| Value   | Action                                                                                                                                                   |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000    | Save parameters when under voltage is not active (Pr <b>10.16</b> = 0) and low voltage DC supply is not active (Pr <b>6.44</b> = 0).                     |
| 1001    | Save parameters under all conditions                                                                                                                     |
| 1070    | Reset all option modules                                                                                                                                 |
| 1233    | Load standard defaults                                                                                                                                   |
| 1244    | Load US defaults                                                                                                                                         |
| 1253    | Change drive mode with standard defaults                                                                                                                 |
| 1254    | Change drive mode with US defaults                                                                                                                       |
| 1255    | Change drive mode with standard defaults (excluding menus 15 to 20)                                                                                      |
| 1256    | Change drive mode with US defaults (excluding menus 15 to 20)                                                                                            |
| 2001*   | Transfer drive parameters as difference from default to a bootable SMARTCARD block in data block number 001                                              |
| Зууу*   | Transfer drive EEPROM data to a SMART Card block<br>number yyy                                                                                           |
| 4ууу*   | Transfer drive data as difference from defaults to SMART<br>Card block number yyy                                                                        |
| 5ууу*   | Transfer drive ladder program to SMART Card block number<br>yyy                                                                                          |
| бууу*   | Transfer SMART Card data block number yyy to the drive                                                                                                   |
| 7ууу*   | Erase SMART Card data block number yyy                                                                                                                   |
| 8ууу*   | Compare drive parameters with SMART Card data block number yyy                                                                                           |
| 9555*   | Clear SMARTCARD warning suppression flag                                                                                                                 |
| 9666*   | Set SMARTCARD warning suppression card                                                                                                                   |
| 9777*   | Clear SMARTCARD read-only flag                                                                                                                           |
| 9888*   | Set SMARTCARD read-only flag                                                                                                                             |
| 9999*   | Erase SMARTCARD data block 1 to 499                                                                                                                      |
| 110zy   | Transfer electronic nameplate parameters to/from drive from/<br>to encoder. See the <i>Advanced User Guide</i> for more<br>information on this function. |
| 12000** | Display non-default values only                                                                                                                          |
| 12001** | Display destination parameters only                                                                                                                      |

\* See Chapter 9 *SMARTCARD operation* on page 143 for more information of these functions.

\*\* These functions do not require a drive reset to become active. All other functions require a drive reset to initiate the function.

### 6.2.2 Speed limits

| 0.0 | 01 {               | 1.07} | Minim                   | um ref | erence | cla | mp | )   |     |    |  |  |
|-----|--------------------|-------|-------------------------|--------|--------|-----|----|-----|-----|----|--|--|
| R۱  | Ν                  | Bi    | Bi                      |        |        |     |    |     | PT  | US |  |  |
| OL  | €                  |       | ±3,000.0Hz              |        |        |     |    | 0.0 |     |    |  |  |
| CL  | $\hat{\mathbb{V}}$ | ±SPEE | ±SPEED_LIMIT_MAX Hz/rpm |        |        |     |    |     | 0.0 |    |  |  |

(When the drive is jogging, [0.01] has no effect.)

### Open-loop

Set Pr 0.01 at the required minimum output frequency of the drive for both directions of rotation. The drive speed reference is scaled between Pr 0.01 and Pr 0.02. [0.01] is a nominal value; slip compensation may cause the actual frequency to be higher.

### Closed-loop

Set Pr **0.01** at the required minimum motor speed for both directions of rotation. The drive speed reference is scaled between Pr **0.01** and Pr **0.02**.

| 0.0 | )2 { | 1.06}          | 0.02 {1.06} Maximum referen |        |          |   |    |    | ce clamp         |                    |  |  |  |  |  |  |
|-----|------|----------------|-----------------------------|--------|----------|---|----|----|------------------|--------------------|--|--|--|--|--|--|
| R١  | N    | Uni            |                             |        |          |   |    | US |                  |                    |  |  |  |  |  |  |
| OL  | €    | 0 to 3,000.0Hz |                             |        | <u>Z</u> | ⇔ |    |    | EUR> 5<br>JSA> 6 |                    |  |  |  |  |  |  |
| CL  | Û    | SPEE           | D_LIMIT                     | _MAX I | -lz/rpm  | ⇔ | VT |    |                  | 1,500.0<br>1,800.0 |  |  |  |  |  |  |
|     |      |                |                             |        |          |   | sv |    | 3,00             | 0.00               |  |  |  |  |  |  |

(The drive has additional over-speed protection.)

### Open-loop

Set Pr **0.02** at the required maximum output frequency for both directions of rotation. The drive speed reference is scaled between Pr **0.01** and Pr **0.02**. **[0.02]** is a nominal value; slip compensation may cause the actual frequency to be higher.

### Closed-loop

Set Pr **0.02** at the required maximum motor speed for both directions of rotation. The drive speed reference is scaled between Pr **0.01** and Pr **0.02**. For operating at high speeds see section 8.6 *High speed operation* on page 141.

### 6.2.3 Ramps, speed reference selection, current limit

| 0.0 | )3 {   | 2.11}      | Acceleration rate |          |      |    |    |  |     |    |  |  |
|-----|--------|------------|-------------------|----------|------|----|----|--|-----|----|--|--|
| R۱  | RW Uni |            |                   |          |      |    |    |  |     | US |  |  |
| OL  | €      | 0.0 t      | o 3,200           | ).0 s/10 | 00Hz | ₽  |    |  | 5.0 |    |  |  |
| CL  | ☆      | 0.0        | 000 to 3,200.000  |          |      | Ц. | VT |  | 2.0 | 00 |  |  |
| 02  | v      | s/1,000rpm |                   |          |      |    | sv |  | 0.2 | 00 |  |  |

Set Pr 0.03 at the required rate of acceleration.

Note that larger values produce lower acceleration. The rate applies in both directions of rotation.

| 0.0 | )4 {2 | 2.21}      | Deceleration rate |          |      |    |        |     |     |     |  |  |
|-----|-------|------------|-------------------|----------|------|----|--------|-----|-----|-----|--|--|
| R١  | N     | Uni        |                   |          |      |    |        |     |     | US  |  |  |
| OL  | ţ     | 0.0 t      | o 3,200           | ).0 s/10 | 00Hz | ₽  | ⇒ 10.0 |     |     |     |  |  |
| CL  | ☆     | 0.0        | 000 to 3          | 00       | 仓    | VT |        | 2.0 | 00  |     |  |  |
|     | v     | s/1,000rpm |                   |          |      |    | sv     |     | 0.2 | 200 |  |  |

Set Pr 0.04 at the required rate of deceleration.

Note that larger values produce lower deceleration. The rate applies in both directions of rotation.

| Safety Product Mechanic<br>Information Information Installatio | I Electrical Getting<br>Installation Started |  | notor Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |

Pr **0.06** limits the maximum output current of the drive (and hence maximum motor torque) to protect the drive and motor from overload.

Set Pr  ${\bf 0.06}$  at the required maximum torque as a percentage of the rated torque of the motor, as follows:

$$[0.06] = \frac{T_R}{T_{RATED}} \times 100 \,(\%)$$

Where:

T<sub>R</sub> Required maximum torque

TRATED Motor rated torque

Alternatively, set 0.06 at the required maximum active (torqueproducing) current as a percentage of the rated active current of the motor, as follows:

$$[0.06] = \frac{I_R}{I_{RATED}} \times 100 \,(\%)$$

Where:

I<sub>R</sub> Required maximum active current I<sub>RATED</sub> Motor rated active current

# 6.2.4 Voltage boost, (open-loop), Speed-loop PID gains (closed-loop)

## **Open-loop**

Set Pr 0.09 (5.13) at 0 when the V/f characteristic applied to the motor is to be fixed. It is then based on the rated voltage and frequency of the motor.

Set Pr **0.09** at 1 when reduced power dissipation is required in the motor when it is lightly loaded. The V/f characteristic is then variable resulting in the motor voltage being proportionally reduced for lower motor currents. Figure 6-2 shows the change in V/f slope when the motor current is reduced.

Pr 0.15 sets the ramp mode of the drive as shown below:

## 0: Fast ramp

Fast ramp is used where the deceleration follows the programmed deceleration rate subject to current limits. This mode must be used if a braking resistor is connected to the drive.

## 1: Standard ramp

Standard ramp is used. During deceleration, if the voltage rises to the standard ramp level (Pr **2.08**) it causes a controller to operate, the output of which changes the demanded load current in the motor. As the controller regulates the link voltage, the motor deceleration increases as the speed approaches zero speed. When the motor deceleration rate reaches the programmed deceleration rate the controller ceases to operate and the drive continues to decelerate at the programmed rate. If the standard ramp voltage (Pr **2.08**) is set lower than the nominal DC bus level the drive will not decelerate the motor, but it will coast to rest. The output of the ramp controller (when active) is a current demand that is fed to the frequency changing current controller (Open-loop modes) or the torque producing current controller (Closed-loop vector or Servo modes). The gain of these controllers can be modified with Pr **4.13** and Pr **4.14**.

## 2: Standard ramp with motor voltage boost

This mode is the same as normal standard ramp mode except that the motor voltage is boosted by 20%. This increases the losses in the motor, dissipating some of the mechanical energy as heat giving faster deceleration.

| 0.1 | 16 {      | 8.39}             | T28 a | T28 and T29 auto-selection disable |  |  |       |    |  |  |  |  |

| CL  | $\hat{v}$                                       | 0.0 to 25.0 ms |  |    | ₽ |  |  | 0.0 |  |  |  |

#### Closed-loop

A first order filter, with a time constant defined by Pr **0.17**, is provided on the current demand to reduce acoustic noise and vibration produced as a result of position feedback quantisation noise. The filter introduces a lag in the speed loop, and so the speed loop gains may need to be reduced to maintain stability as the filter time constant is increased.

| 0.1 | 18 {              | 8.29} | Positi | ve logi | c selec | t |       |    |    |  |

## **Open-loop**

When the drive is enabled with Pr 0.33 = 0, the output frequency starts at zero and ramps to the required reference. When the drive is enabled when Pr 0.33 has a non-zero value, the drive performs a start-up test to determine the motor speed and then sets the initial output frequency to the synchronous frequency of the motor. Restrictions may be placed on the frequencies detected by the drive as follows:

| Pr 0.33 | Function                         |
|---------|----------------------------------|
| 0       | Disabled                         |
| 1       | Detect all frequencies           |
| 2       | Detect positive frequencies only |
| 3       | Detect negative frequencies only |

## **Closed-loop vector**

The motor rated full load rpm parameter (Pr 0.45) in conjunction with the motor rated frequency parameter (Pr 0.46) defines the full load slip of the motor. The slip is used in the motor model for closed-loop vector control. The full load slip of the motor varies with rotor resistance which can vary significantly with motor temperature. When Pr 0.33 is set to 1 or 2, the drive can automatically sense if the value of slip defined by Pr 0.45 and Pr 0.46 has been set incorrectly or has varied with motor temperature. If the value is incorrect parameter Pr 0.45 is automatically adjusted. The adjusted value in Pr 0.45 is not saved at power-down. If the new value is required at the next power-up it must be saved by the user.

Automatic optimisation is only enabled when the speed is above 12.5% of rated speed, and when the load on the motor load rises above 62.5% rated load. Optimisation is disabled again if the load falls below 50% of rated load.

For best optimisation results the correct values of stator resistance (Pr **5.17**), transient inductance (Pr **5.24**), stator inductance (Pr **5.25**) and saturation breakpoints (Pr **5.29**, Pr **5.30**) should be stored in the relevant parameters. These values can be obtained by the drive during an autotune (see Pr **0.40** for further details).

Rated rpm auto-tune is not available if the drive is not using external position/speed feedback.

The gain of the optimiser, and hence the speed with which it converges, can be set at a normal low level when  $\Pr 0.33$  is set to 1. If this parameter is set to 2 the gain is increased by a factor of 16 to give faster convergence.

| 0.3 | 0.34 {11.30} User security code |     |        |    |  |   |  |    |    |  |    |
|-----|---------------------------------|-----|--------|----|--|---|--|----|----|--|----|
| R۱  | Ν                               | Uni |        |    |  |   |  | NC | PT |  | PS |
| €   |                                 |     | 0 to 9 | 99 |  | ₽ |  |    | 0  |  |    |

If any number other than 0 is programmed into this parameter, user security is applied so that no parameters except parameter **0.49** can be adjusted with the keypad. When this parameter is read via a keypad it appears as zero.

For further details refer to section 5.9.3 User Security on page 101.

| 0.35 {11.24} Serial comms mode |                            |  |  |  |  |  |  |  |        |    |  |
|--------------------------------|----------------------------|--|--|--|--|--|--|--|--------|----|--|

This parameter defines the communications protocol used by the EIA485 comms port on the drive. This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original protocol. The master should wait at least 20ms before send a new message using the new protocol. (Note: ANSI uses 7 data bits, 1 stop bit and even parity; Modbus RTU uses 8 data bits, 2 stops bits and no parity.)

| Safety         Product         Mechanical         Electrical         Getting         Basic         Running         Optimization         SMARTCARD         Onboard         Advanced         Technical         Diagnostics         UL           Information         Installation         Installation         Started         parameters         the motor         Optimization         SMARTCARD         Onboard         Advanced         Technical         Diagnostics         Info |

\* only applicable to Modbus RTU mode

This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20ms before send a new message using the new baud rate.

| 0.3 | 0.37 {11.23} Serial comms address |  |        |    |  |   |  |  |   |    |  |
|-----|-----------------------------------|--|--------|----|--|---|--|--|---|----|--|
| R۱  | N Uni                             |  |        |    |  |   |  |  |   | US |  |
| Û   |                                   |  | 0 to 2 | 47 |  | ₽ |  |  | 1 |    |  |

Used to define the unique address for the drive for the serial interface. The drive is always a slave.

## Modbus RTU

When the Modbus RTU protocol is used addresses between 0 and 247 are permitted. Address 0 is used to globally address all slaves, and so this address should not be set in this parameter

## ANSI

When the ANSI protocol is used the first digit is the group and the second digit is the address within a group. The maximum permitted group number is 9 and the maximum permitted address within a group is 9. Therefore, Pr **0.37** is limited to 99 in this mode. The value 00 is used to globally address all slaves on the system, and x0 is used to address all slaves of group x, therefore these addresses should not be set in this parameter.

These parameters control the proportional and integral gains of the current controller used in the open loop drive. The current controller either provides current limits or closed loop torque control by modifying the drive output frequency. The control loop is also used in its torque mode during line power supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate the flow of current into the drive.

## **Open-Loop**

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible, so the measured value of power factor of the motor is used by the drive.

- The stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft.
- A rotating autotune first performs a stationary autotune, before rotating the motor at  $^{2}/_{3}$  base speed in the forward direction for several seconds. The motor must be free from load for the rotating autotune.

To perform an autotune, set Pr **0.40** to 1 for a stationary test or 2 for a rotating test, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF (SECURE DISABLE) signal from terminal 31, setting the drive enable parameter Pr **6.15** to OFF (0) or disabling the drive via the control word (Pr **6.42** & Pr **6.43**).

For further information refer to section *Pr 0.40* {5.12} *Autotune* on page 130.

## Closed-loop

There are three autotune tests available in closed loop vector mode, a stationary test, a rotating test and an inertia measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. An inertia measurement test should be performed separately to a stationary or rotating autotune.

- The stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft.
- A rotating autotune first performs a stationary autotune, before rotating the motor at <sup>2</sup>/<sub>3</sub> base speed in the forward direction for approximately 30 seconds. The motor must be free from load for the rotating autotune.
- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see

| Safety      | Product     | Mechanical   | Electrical   | Gettina | Basic      | Runnina   |              | SMARTCARD | Onboard | Advanced   | Technical |             | UL Listina  |
|-------------|-------------|--------------|--------------|---------|------------|-----------|--------------|-----------|---------|------------|-----------|-------------|-------------|
| Information | Information | Installation | Installation |         | parameters | the motor | Optimization |           | PLC     | parameters | Data      | Diagnostics | Information |
|             |             |              |              |         |            |           |              |           |         |            |           |             |             |

*Speed loop gains*, below) and to provide torque feed forwards when required during acceleration. During the inertia measurement test the motor speed changes from  $1/_3$  to  $2/_3$  rated speed in the forward direction several times. The motor can be loaded with a constant torque load and still give an accurate result, however, non-linear loads and loads that change with speed will cause measurement errors.

To perform an autotune, set Pr **0.40** to 1 for a stationary test, 2 for a rotating test, or 3 for an inertia measurement test and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF (SECURE DISABLE) signal from terminal 31, setting the drive enable parameter Pr **6.15** to OFF (0) or disabling the drive via the control word (Pr **6.42** & Pr **6.43**).

Setting Pr **0.40** to 4 will cause the drive to calculate the current loop gains based on the previously measured values of motor resistance and inductance. The drive does apply any voltage to the motor during this test. The drive will change Pr **0.40** back to 0 as soon as the calculations are complete (approximately 500ms).

For further information refer to section *Pr 0.40* {*5.12*} *Autotune* on page 133.

## Servo

There are five autotune tests available in servo mode, a short low speed test, a normal low speed test, an inertia measurement test, a stationary test and a minimal movement test. A normal low speed should be done where possible as the drive measures the stator resistance and inductance of the motor, and from these calculates the current loop gains. An inertia measurement test should be performed separately to a short low speed or normal low speed autotune.

- A short low speed test will rotate the motor by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the forward direction, and measure the encoder phase angle. The motor must be free from load for this test.
- A normal low speed test will rotate the motor by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the forward direction. This test measures the encoder phase angle and updates other parameters including the current loop gains. The motor must be free from load for this test.
- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains and to provide torque feed forwards when required during acceleration. During the inertia measurement test the motor speed changes from

 $^{1}/_{3}$  to  $^{2}/_{3}$  rated speed in the forward direction several times. The motor can be loaded with a constant torque load and still give an accurate result, however, non-linear loads and loads that change with speed will cause measurement errors.

- The stationary test only measures the motor resistance and inductance, and updates the current loop gain parameters. This test does not measure the encoder phase angle so this test needs to be done in conjunction with either the short low speed or minimal movement tests.
- The minimal movement test will move the motor through a small angle to measure the encoder phase angle. This test will operate correctly when the load is an inertia, and although a small amount of cogging and stiction is acceptable, this test cannot be used for a loaded motor.

To perform an autotune, set Pr **0.40** to 1 for a short low speed test, 2 for a normal low speed test, 3 for an inertia measurement test, 4 for a stationary test or 5 for a minimal movement test, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF (SECURE DISABLE) signal from terminal 31, setting the drive enable parameter Pr **6.15** to OFF (0) or disabling the drive via the control word (Pr **6.42** & Pr **6.43**).

Setting Pr **0.40** to 6 will cause the drive to calculate the current loop gains based on the previously measured values of motor resistance and inductance. The drive does apply any voltage to the motor during this test. The drive will change Pr **0.40** back to 0 as soon as the calculations are complete (approximately 500ms).

For further information refer to section *Pr 0.40* {5.12} *Autotune* on page 138.

| <u>S</u> L |           |              |                       | . ,                  |              | -7    | sv  |      | 6 (   | 2) |  |

This parameter defines the required switching frequency. The drive may automatically reduce the actual switching frequency (without changing this parameter) if the power stage becomes too hot. A thermal model of the IGBT junction temperature is used based on the heatsink temperature and an instantaneous temperature drop using the drive output current and switching frequency. The estimated IGBT junction temperature is displayed in Pr **7.34**. If the temperature exceeds 145°C the switching frequency is reduced if this is possible (i.e >3kHz). Reducing the switching frequency reduces the drive losses and the junction temperature displayed in Pr **7.34** also reduces. If the load condition persists the junction temperature may continue to rise again above 145°C and the drive cannot reduce the switching frequency further the drive will initiate an 'O.ht1' trip. Every second the drive will attempt to restore the switching frequency to the level set in Pr **0.41**.

The full range of switching frequencies is not available on all ratings of Unidrive SP. See section 8.5 *Switching frequency* on page 141, for the maximum available switching frequency for each drive rating.

## 6.2.7 Motor parameters

## **Open-loop**

This parameter is used in the calculation of motor speed, and in applying the correct slip compensation. When auto is selected, the number of motor poles is automatically calculated from the rated frequency (Pr **0.47**) and the rated full load rpm (Pr **0.45**). The number of poles =  $120 \times 1000$  rpm rounded to the nearest even number.

## **Closed-loop vector**

This parameter must be set correctly for the vector control algorithms to operate correctly. When auto is selected, the number of motor poles is automatically calculated from the rated frequency (Pr **0.47**) and the rated full load rpm (Pr **0.45**). The number of poles =  $120 \times 120 \times 120$ 

## Servo

This parameter must be set correctly for the vector control algorithms to operate correctly. When auto is selected the number of poles is set to 6.

| 0.4 | 3 {! | 5.10} | Motor    | rated   | power | factor |      |    |  |
|-----|------|-------|----------|---------|-------|--------|------|----|--|
| RW  | V    | Uni   |          |         |       |        |      | US |  |
| OL  | ţ    |       | 0.000 te | n 1 000 | 1     | ⇔      | 0.85 | n  |  |
| VT  | ţ    |       | 0.000 1  | 5 1.000 | •     | ⇒      | 0.00 | 0  |  |

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current.

## **Open-loop**

The power factor is used in conjunction with the motor rated current (Pr **0.46**) to calculate the rated active current and magnetising current of the motor. The rated active current is used extensively to control the drive, and the magnetising current is used in vector mode Rs compensation. It is important that this parameter is set up correctly.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr 0.43.

## **Closed-loop vector**

If the stator inductance (Pr **5.25**) contains a non-zero value, the power factor used by the drive is continuously calculated and used in the vector control algorithms (this will not update Pr **0.43**).

If the stator inductance is set to zero (Pr **5.25**) then the power factor written in Pr **0.43** is used in conjunction with the motor rated current and other motor parameters to calculate the rated active and magnetising currents which are used in the vector control algorithm.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **0.43**.

| 0.4 | 43 {  | 3.25}         | Encoc | ler pha | ise ang | le |  |     |    |  |
|-----|-------|---------------|-------|---------|---------|----|--|-----|----|--|
| R١  | RW Ur |               |       |         |         |    |  |     | US |  |
| sv  | ţ     | 0.0 to 359.9° |       |         |         | ⇒  |  | 0.0 |    |  |

The phase angle between the rotor flux in a servo motor and the encoder position is required for the motor to operate correctly. If the phase angle is known it can be set in this parameter by the user. Alternatively the drive can automatically measure the phase angle by performing a phasing test (see autotune in servo mode Pr **0.40**). When the test is complete the new value is written to this parameter. The encoder phase angle can be modified at any time and becomes effective immediately. This parameter has a factory default value of 0.0, but is not affected when defaults are loaded by the user.

## Open-loop

This is the speed at which the motor would rotate when supplied with its base frequency at rated voltage, under rated load conditions (=

synchronous speed - slip speed). Entering the correct value into this parameter allows the drive to increase the output frequency as a function of load in order to compensate for this speed drop.

Slip compensation is disabled if Pr **0.45** is set to 0 or to synchronous speed, or if Pr **5.27** is set to 0.

If slip compensation is required this parameter should be set to the value from the rating plate of the motor, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

#### **Closed loop vector**

Rated load rpm is used with motor rated frequency to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter can result in the following:

- Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- Failure to reach maximum speed
- Over-current trips
- Reduced transient performance

• Inaccurate control of absolute torque in torque control modes The nameplate value is normally the value for a hot machine, however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate.

The rated full load rpm can be optimised by the drive (For further information, refer to section 8.1.3 *Closed loop vector motor control* on page 135).

## Servo

Pr 0.45 is the motor thermal time constant of the motor, and is used (along with the motor rated current Pr 0.46, and total motor current Pr 0.12) in the thermal model of the motor in applying thermal protection to the motor.

Setting this parameter to 0 disables the motor thermal protection.

For further details, refer to section 8.4 *Motor thermal protection* on page 140.

| 0.4 | 46 { | 5.07}                    | Motor | rated | current |   |   |          |         |                  |      |

## 6.2.8 Operating-mode selection

| 0.4 | .48 {11.31} Operating mode s |     |    |  |   |    | tor |    |   |  |
|-----|------------------------------|-----|----|--|---|----|-----|----|---|--|
| R۱  | N                            | Txt | NC |  |   |    |     | PT |   |  |
|     |                              |     |    |  |   |    | OL  |    | 1 |  |
| Û   | 1 to 4                       |     |    |  | ⇔ | VT | 2   | 2  |   |  |
|     |                              |     |    |  |   |    | sv  | :  | 3 |  |

The settings for Pr 0.48 are as follows:

| Setting |   | Operating mode     |
|---------|---|--------------------|
| OPEn LP | 1 | Open-loop          |
| CL VECt | 2 | Closed-loop vector |
| SerVO   | 3 | Servo              |
| rEgEn   | 4 | Regen              |

This parameter defines the drive operating mode. Pr **xx.00** must be set to 1253 (European defaults) or 1254 (USA defaults) before this parameter can be changed. When the drive is reset to implement any change in this parameter, the default settings of all parameters will be set according to the drive operating mode selected and saved in memory.

## 6.2.9 Status information

| 0.4 | .49 {11.44} Security status |     |  |  |   |  |  |   |    |    |  |
|-----|-----------------------------|-----|--|--|---|--|--|---|----|----|--|
| R١  | N                           | Txt |  |  |   |  |  |   | PT | US |  |
| €   | 0 to 2                      |     |  |  | ⇒ |  |  | 0 |    |    |  |

This parameter controls access via the drive keypad as follows:

| Value | String | Action                                     |
|-------|--------|--------------------------------------------|
| 0     | L1     | Only menu 0 can be accessed                |
| 1     | L2     | All menus can be accessed                  |
| 2     | Loc    | Lock user security when drive is reset.    |
|       |        | (This parameter is set to L1 after reset.) |

The keypad can adjust this parameter even when user security is set.

| 0.5 | 0.50 {11.29} Software version number |     |  |  |  |   |  |    |    |  |  |
|-----|--------------------------------------|-----|--|--|--|---|--|----|----|--|--|
| R   | 0                                    | Uni |  |  |  |   |  | NC | PT |  |  |
| Û   | 1.00 to 99.99                        |     |  |  |  | ⇔ |  |    |    |  |  |

The parameter displays the software version of the drive.

| 0.5                | 0.51 {10.37} Action on trip detection |     |  |  |   |  |  |   |  |    |  |
|--------------------|---------------------------------------|-----|--|--|---|--|--|---|--|----|--|
| R١                 | N                                     | Uni |  |  |   |  |  |   |  | US |  |
| $\hat{\mathbf{v}}$ | 0 to 15                               |     |  |  | Û |  |  | 0 |  |    |  |

Each bit in this parameter has the following functions:

| Bit | Function                                                                                     |  |  |  |  |  |  |  |  |
|-----|----------------------------------------------------------------------------------------------|--|--|--|--|--|--|--|--|
| 0   | Stop on non-important trips                                                                  |  |  |  |  |  |  |  |  |
| 1   | Disable braking IGBT trips                                                                   |  |  |  |  |  |  |  |  |
| 2   | Disable phase loss trip (Unidrive SP size 0 only)                                            |  |  |  |  |  |  |  |  |
| 3   | Disable braking resistor temperature monitoring failure detection. (Unidrive SP size 0 only) |  |  |  |  |  |  |  |  |

## Stop on non-important trips

If bit 0 is set to zero then the drive simply trips when a non-important trip occurs. Non-important trips are: th, ths, Old1, cL2, cL3, SCL. If bit 0 is set to one the drive will stop before tripping when one of these trips is initiated, except in Regen mode where the drive trips immediately.

## Disable braking IGBT trips

For details of braking IGBT trip mode see Pr 10.31.

## Disable phase loss trip (size 0 only)

The user can disable the phase loss trip in 200V size 0 drives as these are allowed to operate from a single phase supply. If bit 2 is set to zero the phase loss trip is enabled. If bit 2 is set to one the phase loss trip is disabled in 200V size 0 drives only.

# Disable braking resistor temperature monitoring failure detection (size 0 only)

Size 0 drives have an internal user fit braking resistor with a thermistor to detect overheating of the resistor. As default bit 3 of Pr **10.37** is set to zero, and so if the braking resistor and its thermistor is not installed the drive will produce a trip (br.th) because the thermistor appears to be open-circuit. This trip can be disabled so that the drive can run by setting bit 3 of Pr **10.37** to one. If the resistor is installed then no trip is produced unless the thermistor fails, and so bit 3 of Pr **10.37** can be left at zero. This feature only applies to size 0 drives.

# 7 Running the motor

This chapter takes the new user through all the essential steps to running a motor for the first time, in each of the possible operating modes.

For information on tuning the drive for the best performance, see Chapter 8 Optimization .

Ensure that no damage or safety hazard could arise from the motor starting unexpectedly.

The values of the motor parameters affect the protection of the motor.

The default values in the drive should not be relied upon. It is essential that the correct value is entered in Pr **0.46** *Motor rated current*. This affects the thermal protection of the motor.

If the keypad mode has been used previously, ensure that

the keypad reference has been set to 0 using the buttons as if the drive is started using the keypad it will run to

the speed defined by the keypad reference (Pr 0.35).

If the intended maximum speed affects the safety of the machinery, additional independent over-speed protection must be used.

## 7.1 Quick start Connections

## 7.1.1 Basic requirements

This section shows the basic connections which must be made for the drive to run in the required mode. For minimal parameter settings to run in each mode please see the relevant part of section 7.3 *Quick Start commissioning/start-up* on page 122.

# Table 7-1 Minimum control connection requirements for each control mode

| Drive control method  | Requirements                                                             |
|-----------------------|--------------------------------------------------------------------------|
| Terminal mode         | Drive Enable<br>Speed reference<br>Run forward or run reverse<br>command |
| Keypad mode           | Drive Enable                                                             |
| Serial communications | Drive Enable<br>Serial communications link                               |

# Table 7-2 Minimum control connection requirements for each mode of operation

| Operating mode                | Requirements                                            |
|-------------------------------|---------------------------------------------------------|
| Open loop mode                | Induction motor                                         |
| Closed loop vector - RFC mode | Induction motor                                         |
| Closed loop vector mode       | Induction motor with speed<br>feedback                  |
| Closed loop servo mode        | Permanent magnet motor with speed and position feedback |

## Speed feedback

## Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z)
- Incremental encoder with forward and reverse outputs (F, R with or without Z)
- SINCOS encoder (with, or without Stegmann Hiperface, EnDat or SSI communications protocols)
- EnDat absolute encoder

## Speed and position feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z) with commutation signals (U, V, W)
- Incremental encoder with forward and reverse outputs (F, R with or without Z) and commutation outputs (U, V, W)
- SINCOS encoder (with Stegmann Hiperface, EnDat or SSI communications protocols)
- EnDat absolute encoder

For Solutions Module terminal information see section 11.15 *Menus 15, 16 and 17: Solutions Module set-up* on page 209 or the appropriate Solutions Module option user guide.

## 7.2 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. (Pr 0.49 and Pr 0.34 are not affected by this procedure.)

## Procedure

Use the following procedure only if a different operating mode is required:

- Enter either of the following values in Pr xx.00, as appropriate: 1253 (EUR, 50Hz AC supply frequency) 1254 (USA, 60Hz AC supply frequency)
- 2. Change the setting of Pr 0.48 as follows:

| Pr 0.48 setting |   | Operating mode                                                                                               |
|-----------------|---|--------------------------------------------------------------------------------------------------------------|
| 048<br>026n 12  | 1 | Open-loop                                                                                                    |
| С. UECE         | 2 | Closed-loop vector                                                                                           |
| 0,48<br>56-00   | 3 | Closed-loop Servo                                                                                            |
| 048<br>FE9En    | 4 | Regen (See the Unidrive SP Regen<br>Installation Guide for more information<br>about operating in this mode) |

The figures in the second column apply when serial communications are used.

## 3. Either:

- Press the red 
   reset button
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

| Safety    | Product        | Mechanical   | Electrical   | Getting | Basic      | Running   | Ontimization | SMARTCARD | Onboard | Advanced   | Technical | Diagnostics | UL Listing  |

| Autotune                              | <ul> <li>The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.</li> <li>A rotating autotune will cause the motor to accelerate up to <sup>2</sup>/<sub>3</sub> base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable.</li> <li>A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. A stationary autotune measures the stator resistance of the motor and the voltage offset in the drive. These are required for good performance in vector control modes. A stationary autotune does not measure the power factor of the motor is uncoupled. A rotating autotune first performs a stationary autotune measures the power factor of the motor as the rotating the motor is uncoupled. A rotating autotune first perform an autotune:</li> <li>Set Pr 0.40 = 1 for a stationary autotune or set Pr 0.40 = 2 for a rotating autotune</li> <li>Close the Drive Enable signal (terminal 31). The drive will flash 'Auto' and 'tunE' alternatively, while the drive is performing the autotune.</li> <li>Wait for the drive to display 'rdY' or 'inh' and for the motor to come to a standstill. If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 276. Remove the drive enable and run signal from the drive.</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Select or<br>deselect catch a<br>spinning motor<br>mode      | If catch a spinning motor mode is not required then set Pr <b>6.09</b> to 0.<br>If catch a spinning motor mode is required then leave Pr <b>6.09</b> at the default of 1, but depending on the size of<br>the motor the value in Pr <b>5.40</b> may need to be adjusted.<br>Pr <b>5.40</b> defines a scaling function used by the algorithm that detects the speed of the motor. The default value<br>of Pr <b>5.40</b> is 1 which is suitable for small motors (<4kW). For larger motors the value in Pr <b>5.40</b> will need to be<br>increased. Approximate values of Pr <b>5.40</b> for different motor sizes are as follows, 2 for 11kW, 3 for 55kW and<br>5 for 150kW. If the value of Pr <b>5.40</b> is too large the motor may accelerate from standstill when the drive is<br>enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the<br>motor is spinning. |                                                                                        |
|                                                              | The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive.  NOTE It is highly recommended that a rotating autotune is performed (Pr 0.40 set to 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                        |
|                                                              | A rotating autotune will cause the motor to accelerate up to $\frac{2}{3}$ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                        |
| Autotune                                                     | <ul> <li>A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. The stationary autotune measures the stator resistance and transient inductance of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 0.38 and Pr 0.39 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 0.43.</li> <li>A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at 2/3 base speed in the direction selected. The rotating autotune measures the stator inductance of the motor and calculates the power factor.</li> </ul>                                                                                           | R <sub>s</sub><br>d <sub>s</sub><br>T<br>Nm<br>Saturation<br>break-<br>points<br>N rpm |

## 7.3.3 Closed loop vector mode

## Induction motor with incremental encoder feedback

For simplicity only an incremental quadrature encoder will be considered here. For information on setting up one of the other supported speed feedback devices, refer to section 7.5 Setting up a feedback device on page 126.

| Action                                      | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |

|                                             | Unidrive SP is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive.<br>A rotating autotune will cause the motor to accelerate up to <sup>2</sup> / <sub>3</sub> base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference.                                                                                                                                                                                                                                                                                                                                                                        |                              |
| Autotune                                    | <ul> <li>The drive can be stopped at any time by removing the run signal or removing the drive enable.</li> <li>A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. The stationary autotune measures the stator resistance and transient inductance of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 0.38 and Pr 0.39 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 0.43.</li> <li>A rotating autotune before rotating the motor at <sup>2</sup>/<sub>3</sub> base speed in the direction selected. The rotating autotune measures the stator and calculates the power factor. To perform an autotune:</li> <li>Set Pr 0.40 = 1 for a stationary autotune or set Pr 0.40 = 2 for a rotating autotune</li> <li>Close the Drive Enable signal (terminal 31). The drive will display 'rdY'</li> </ul> | Rs dLs Dreak-<br>points Nrpm |
| Save parameters                             | <ul> <li>Close the run signal (terminal 26 or 27). The ower display will flash 'Auto' and 'tunE' alternatively, while the drive is performing the autotune.</li> <li>Wait for the drive to display 'rdY' or 'inh' and for the motor to come to a standstill If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 276. Remove the drive enable and run signal from the drive.</li> <li>Enter 1000 in Pr xx.00</li> <li>Press the red image reset button or toggle the reset digital input (ensure Pr xx.00 returns to 0)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                              |
| Run                                         | Drive is now ready to run                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | * O                          |

7.3.4 Servo
 Permanent magnet motor with a speed and position feedback device
 For simplicity only an incremental quadrature encoder with commutation outputs will be considered here. For information on setting up one of the other supported speed feedback devices, refer to section 7.5 Setting up a feedback device on page 126.

| Action                      | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                        |

# 7.4 Quick start commissioning/start-up (CTSoft)

CTSoft is a Windows™ based software commissioning/start-up tool for Unidrive SP and other EPA products.

CTSoft can be used for commissioning/start-up and monitoring, drive parameters can be uploaded, downloaded and compared, and simple or custom menu listings can be created. Drive menus can be displayed in standard list format or as live block diagrams. CTSoft is able to communicate with a single drive or a network.

CTSoft can be delivered on CD.

CTSoft system requirements:

- Windows 2000/XP/Vista. Windows 95/98/98SE/ME/NT4 and Windows 2003 server are NOT supported
- Internet Explorer V5.0 or later must be installed
- Minimum of 800x600 screen resolution with 256 colors. 1024x768 is recommended.
- 128MB RAM
- Pentium III 500MHz or better recommended.
- Adobe Acrobat Reader 5.1 or later (for parameter help). See CD provided
- Microsoft.Net Frameworks 2.0
- Note that you must have administrator rights to install CTSoft.

To install CTSoft from the CD, insert the CD and the auto-run facility should start up the front-end screen from which CTSoft can be selected. Any previous copy of CTSoft should be uninstalled before proceeding with the installation (existing projects will not be lost).

Included with CTSoft are the user guides for the supported drive models. When help on a particular parameter is request by the user, CTSoft links to the parameter in the relevant advanced user guide.

## 7.5 Setting up a feedback device

This section shows the parameter settings which must be made to use each of the compatible encoder types with Unidrive SP. For more information on the parameters listed here please refer to the *Unidrive SP Advanced User Guide*.

## 7.5.1 Overview

## Table 7-3 Parameters required for feedback device set-up

|      | Parameter                                                           | Ab, Fd, Fr,<br>Ab.SErVO,<br>Fd.SErVO, Fr.SErVO,<br>or SC encoders | SC.HiPEr<br>encoder | SC.EndAt or<br>SC.SSI<br>encoders | EndAt<br>encoder | SSI encoder |
|------|---------------------------------------------------------------------|-------------------------------------------------------------------|---------------------|-----------------------------------|------------------|-------------|
| 3.33 | Drive encoder turns                                                 |                                                                   | √ x                 | √ x                               | √ x              | ✓           |
| 3.34 | Drive encoder lines per revolution                                  | ✓                                                                 | √ x                 | √ x                               |                  |             |
| 3.35 | Drive encoder comms resolution                                      |                                                                   | √ x                 | √ x                               | √ x              | ~           |

✓ Information required

x Parameter can be set-up automatically by the drive through auto-configuration

\* Pr 3.36: If the output voltage from the encoder is >5V, then termination resistors must be disabled by setting Pr 3.39 to 0.

Table 7-3 shows a summary of the parameters required to set-up each feedback device. More detailed information follows.

## 7.5.3 Restriction of encoder number of lines per revolution

Although Pr **3.34** can be set to any value from 0 to 50,000 there are restrictions on the values actually used by the drive. These restrictions are dependent on the software version as follows:

## Software version V01.06.01 and later

Table 7-4 Restrictions of drive encoder lines per revolution with software version V01.06.01 and later

| Position feedback device                        | Equivalent Lines per revolution used by the drive                                                                                                                                                                                            |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

At power-up Pr **3.48** is initially zero, but is set to one when the drive encoder and any encoders connected to any Solutions Modules have been initialised. The drive cannot be enabled until this parameter is one.

Encoder initialisation will occur as follows:

- At drive power-up
- When requested by the user via Pr 3.47
- When trips PS.24V, Enc1 to Enc8, or Enc11 to Enc17 trips are reset
- The encoder number of lines per revolution (Pr 3.34) or the number of motor poles (Pr 5.11 and Pr 21.11) are changed (software version V01.08.00 and later).

Initialisation causes an encoder with communications to be re-initialised and auto-configuration to be performed if selected. After initialisation Ab.SErVO, Fd.SErVO and Fr.SErVO encoders will use the UVW commutations signals to give position feedback for the first 120° (electrical) of rotation when the motor is restarted.

## Pr 0.07 {5.14} Voltage mode

There are six voltage modes available which fall into two categories, vector control and fixed boost.

#### Vector control

Vector control mode provides the motor with a linear voltage characteristic from 0Hz to motor rated frequency (Pr **0.47**), and then a constant voltage above motor rated frequency. When the drive operates between motor rated frequency/50 and motor rated frequency/4, full vector based stator resistance compensation is applied. When the drive operates between motor rated frequency/4 and motor rated frequency/2 the stator resistance compensation is gradually reduced to zero as the frequency increases. For the vector modes to operate correctly the motor rated power factor (Pr **0.43**), stator resistance (Pr **5.17**) and voltage offset (Pr **5.23**) are all required to be set up accurately. The drive can be made to measure these by performing an autotune (see Pr **0.40** Autotune). The drive can also be made to measure the stator resistance and voltage offset automatically every time the drive is enabled or the first time the drive is enabled after it is powered up, by selecting one of the vector control voltage modes.

(0)  $\mathbf{Ur}_{\mathbf{S}}$  = The stator resistance and the voltage offset are measured and the parameters for the selected motor map are over-written each time the drive is made to run. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is made to run. To prevent the test from being done before the flux has decayed there is a period of 1 second after the drive has been in the ready state during which the test is not done if the drive is made to run again. In this case, previously measured values are used. Ur\_s mode ensures that the drive compensates for any change in motor parameters due to changes in temperature. The new values of stator resistance and voltage offset are not automatically saved to the drive's EEPROM. (4)  $\mathbf{Ur}_{-1}$  = The stator resistance and voltage offset are measured when the drive is first made to run after each power-up. This test can only be done with a stationary motor. Therefore this mode should only be used if the motor is guaranteed to be stationary the first time the drive is made to run after each power-up. The new values of stator resistance and voltage offset are not automatically saved to the drive's EEPROM. (1)  $\mathbf{Ur}$  = The stator resistance and voltage offset are not measured. The user can enter the motor and cabling resistance into the stator resistance parameter (Pr **5.17**). However this will not include resistance effects within the drive inverter. Therefore if this mode is to be used, it is best to use an autotune test initially to measure the stator resistance and voltage offset.

(3) **Ur\_Auto=** The stator resistance and voltage offset are measured once, the first time the drive is made to run. After the test has been completed successfully the voltage mode (Pr **0.07**) is changed to Ur mode. The stator resistance (Pr **5.17**) and voltage offset (Pr **5.23**) parameters are written to, and along with the voltage mode (Pr **0.07**), are saved in the drive's EEPROM. If the test fails, the voltage mode will stay set to Ur\_Auto and the test will be repeated next time the drive is made to run.

## **Fixed boost**

Neither the stator resistance nor the voltage offset are used in the control of the motor, instead a fixed characteristic with low frequency voltage boost as defined by parameter Pr **0.08**, is used. Fixed boost mode should be used when the drive is controlling multiple motors. There are two settings of fixed boost available:

(2) **Fd** = This mode provides the motor with a linear voltage characteristic from 0Hz to rated frequency (Pr **0.47**), and then a constant voltage above rated frequency.

(5) **SrE** = This mode provides the motor with a square law voltage characteristic from 0Hz to rated frequency (Pr **0.47**), and then a constant voltage above rated frequency. This mode is suitable for variable torque applications like fans and pumps where the load is proportional to the square of the speed of the motor shaft. This mode should not be used if a high starting torque is required.

For both these modes, at low frequencies (from 0Hz to ½ x Pr 0.47) a voltage boost is applied defined by Pr 0.08 as shown below:

## Pr 5.27 Slip compensation

When a motor, being controlled in open loop mode, has load applied a characteristic of the motor is that the output speed droops in proportion to the load applied as shown:

In order to prevent the speed droop shown above slip compensation should be enabled.

To enable slip compensation Pr **5.27** must be set to a 1 (this is the default setting), and the motor rated speed must be entered in Pr **0.45** (Pr **5.08**). The motor rated speed parameter should be set to the synchronous speed of the motor minus the slip speed. This is normally displayed on the motor nameplate, i.e. for a typical 18.5kW, 50Hz, 4 pole motor, the motor rated speed would be approximately 1465rpm. The synchronous speed for a 50Hz, 4 pole motor is 1500rpm, so therefore the slip speed would be 35rpm.

If the synchronous speed is entered in Pr 0.45, slip compensation will be disabled. If too small a value is entered in Pr 0.45, the motor will run faster than the demanded frequency.

The synchronous speeds for 50Hz motors with different numbers of poles are as follows:

2 pole = 3000rpm, 4 pole = 1500rpm, 6pole =1000rpm, 8 pole = 750rpm

## 8.1.2 RFC mode

Software V01.10.00 or later should be used for RFC mode.

## Pr 0.46 {5.07} Motor rated current

#### Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. (See section 8.2 *Maximum motor rated current* on page 140, for information about setting this parameter higher than the maximum Heavy Duty current rating.) The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 140, for more information)
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 140, for more information)
- Vector control algorithm

## Defines the voltage applied to the motor at rated frequency Defines the frequency at which rated voltage is applied

Pr 0.47 {5.06} Motor rated frequency

Pr 0.44 {5.09} Motor rated voltage

The motor rated voltage Pr **0.44** and the motor rated frequency Pr **0.47** are used to define the relationship between the voltage and frequency applied to the motor, as shown.

The motor rated voltage is used by the field controller to limit the voltage applied to the motor. Normally this is set to the nameplate value. To allow current control to be maintained, it is necessary for the drive to leave some 'headroom' between the motor terminal voltage and the maximum available drive output voltage. For good transient performance at high speed, the motor rated voltage should be set below 95% of the minimum supply voltage to the drive.

The motor rated voltage and motor rated frequency are also used during the rotating autotune test (see Autotune Pr **0.40** later in this table) and in the calculations required for automatic optimization of the motor rated speed (see Motor rated speed optimization Pr **5.16**, later in this table). Therefore, it is important that the correct value for motor rated voltage is used.

## Pr 0.45 {5.08} Motor rated speed

## Pr 0.42 {5.11} Motor number of poles

## Defines the number of motor poles

The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects:

- Reduced efficiency of motor operation
- · Reduction of maximum torque available from the motor
- Reduced transient performance
- Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see Motor rated speed autotune Pr **5.16**, later in this table).

When Pr 0.42 is set to 'Auto', the number of motor poles is automatically calculated from the motor rated frequency Pr 0.47, and the motor rated speed Pr 0.45

Number of poles = 120 x (Motor rated frequency Pr 0.47 / Motor rated speed Pr 0.45) rounded to the nearest even number

# Pr 0.43 {5.10} Motor rated power factor Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the stator inductance is set to zero (Pr **5.25**) then the power factor is used in conjunction with the motor rated current Pr **0.46** and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see Autotune Pr **0.40**, later in this table).

## Speed loop gains (Pr 0.07 {3.10}, Pr 0.08 {3.11}, Pr 0.09 {3.12})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr **3.16**. If Pr **3.16** = 0, gains Kp1, Ki1 and Kd1 (Pr **0.07** to Pr **0.09**) are used, and if Pr **3.16** = 1, gains Kp2, Ki2 and Kd2 (Pr **3.13** to Pr **3.15**) are used. Pr **3.16** may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr **3.17**.

## Proportional gain (Kp), Pr 0.07 {3.10} and Pr 3.13

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

## Integral gain (Ki), Pr 0.08 {3.11} and Pr 3.14

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC mode, it is unlikely that the integral gain can be increased much above 0.50.

## Differential gain (Kd), Pr 0.09 {3.12} and Pr 3.15

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are three methods of tuning the speed loop gains dependant on the setting of Pr 3.17:

## 1. Pr 3.17 = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

## 2. Pr 3.17 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

- Pr 3.20 Required bandwidth,
- Pr 3.21 Required damping factor,

Pr **3.18** - Motor and load inertia. The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr **0.40**, earlier in this table).

## 3. Pr 3.17 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 3.19 - Required compliance angle,

Pr 3.21 - Required damping factor,

Pr **3.18** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr **0.40**, earlier in this table).

| The motor rated voltage Pr <b>0.44</b> and the motor rated frequency Pr <b>0.47</b> are used to define the relationship between the voltage and frequency applied to the motor, as shown.<br>The motor rated voltage is used by the field controller to limit the voltage applied to the motor. Normally this is set to the nameplate value. To allow current control to be maintained, it is necessary for the drive to leave some 'headroom' between the motor terminal voltage and the maximum available drive output voltage. For good transient performance at high speed, the motor rated voltage should be set below 95% of the minimum supply voltage to the drive.<br>The motor rated voltage and motor rated frequency are also used during the rotating autotune test (see Autotune Pr <b>0.40</b> later in this table) and in the calculations required for automatic optimization of the motor rated speed (see Motor rated speed optimization Pr <b>5.16</b> , later in this table). Therefore, it is important that the correct value for motor rated voltage is used. | Output voltage characteristic<br>Pr 0.44<br>Pr 0.44 / 2<br>Pr 0.47 / 2 Pr 0.47 Output<br>frequency                                         |

**5.25**) then the power factor is used in conjunction with the motor rated current Pr **0.46** and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see Autotune Pr **0.40**, later in this table).

## Pr 0.40 {5.12} Autotune

There are three autotune tests available in closed loop vector mode, a stationary test, a rotating test and an inertia measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. An inertia measurement test should be performed separately to a stationary or rotating autotune.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the stator resistance (Pr 5.17) and transient inductance (Pr 5.24) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 4.13 and Pr 4.14 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 0.43. To perform a Stationary autotune, set Pr 0.40 to 1, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune before rotating the motor at <sup>2</sup>/<sub>3</sub> of motor rated frequency in the direction selected for approximately 30s. During the rotating autotune the stator inductance (Pr **5.25**), and the motor saturation breakpoints (Pr **5.29** and Pr **5.30**) are modified by the drive. The power factor is also modified for user information only, but is not used after this point as the stator inductance is used in the vector control algorithm instead. To perform a Rotating autotune, set Pr **0.40** to 2, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see Speed loop gains) and to provide torque feed-forwards when required during acceleration.

During the inertia measurement test the drive attempts to accelerate the motor in the direction selected up to  ${}^{3}{}_{4}$  x rated load rpm and then back to standstill. The drive uses rated torque/16, but if the motor cannot be accelerated to the required speed the drive then increases the torque progressively to  $x{}^{1}{}_{8}$ ,  $x{}^{1}{}_{4}$ ,  $x{}^{1}{}_{2}$  and x1 rated torque. If the required speed is not achieved on the final attempt the test is aborted and a tunE1 trip is initiated. If the test is successful the acceleration and deceleration times are used to calculate the motor and load inertia which is then written to Pr **3.18**. The motor map parameters must be set up correctly including the power factor before performing an inertia measurement test. To perform an Inertia measurement autotune, set Pr **0.40** to 3, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF (SECURE DISABLE) signal from terminal 31, setting the drive enable parameter Pr **6.15** to OFF (0) or disabling the drive via the control word (Pr **6.42** & Pr **6.43**).

## Pr 5.16 Motor rated speed autotune

The motor rated speed parameter (Pr **0.45**) in conjunction with the motor rated frequency parameter (Pr **0.47**) defines the full load slip of the motor. The slip is used in the motor model for closed-loop vector control. The full load slip of the motor varies with rotor resistance which can vary significantly with motor temperature. When Pr **5.16** is set to 1 or 2 the drive can automatically sense if the value of slip defined by Pr **0.47** and Pr **0.45** has been set incorrectly or if it has varied with motor temperature. If the value is incorrect Pr **0.45** is automatically adjusted. Pr **0.45** is not saved at power-down, and so when the drive is powered-down and up again it will return to the last saved value. If the new value is required at the next power-up it must be saved by the user. Automatic optimization is only enabled when the speed is above rated speed/8, and when the load on the motor load rises above  $\frac{5}{8}$  rated load. Optimization is disabled again if the load falls below  $\frac{1}{2}$  rated load. For best optimization results the correct values of stator resistance (Pr **5.17**), transient inductance (Pr **5.24**), stator inductance (Pr **5.25**) and saturation breakpoints (Pr **5.29**, Pr **5.30**) should be stored in the relevant parameters (all these can be measured by the drive by performing a rotating autotune). Motor rated speed autotune is not available if the drive is not using external position/speed feedback.

The gain of the optimizer, and hence the speed with which it converges, can be set at a normal low level when Pr **5.16** is set to 1. If this parameter is set to 2, the gain is increased by a factor of 16 to give faster convergence.

## Pr 0.38 {4.13} / Pr 0.39 {4.14} Current loop gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain (Pr **4.13**) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by one of the following:

- During a stationary or rotating autotune (see Autotune Pr 0.40, earlier in this table) the drive measures the stator resistance (Pr 5.17) and transient inductance (Pr 5.24) of the motor and calculates the current loop gains.
- By setting Pr 0.40 to 4 the drive will calculate the current loop gains from the values of stator resistance (Pr 5.17) and transient inductance (Pr 5.24) set in the drive.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5% overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed closed-loop induction motor applications) the integral gain may need to have a significantly higher value.

## Speed loop gains (Pr 0.07 {3.10}, Pr 0.08 {3.11}, Pr 0.09 {3.12})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 3.16. If Pr 3.16 = 0, gains Kp1, Ki1 and Kd1 (Pr 0.07 to Pr 0.09) are used, and if Pr 3.16 = 1, gains Kp2, Ki2 and Kd2 (Pr 3.13 to Pr 3.15) are used. Pr 3.16 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 3.17.

## Proportional gain (Kp), Pr 0.07 {3.10} and Pr 3.13

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the closed-loop stability limit is reached.

## Integral gain (Ki), Pr 0.08 {3.11} and Pr 3.14

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application.

## Differential gain (Kd), Pr 0.09 {3.12} and Pr 3.15

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are three methods of tuning the speed loop gains dependant on the setting of Pr 3.17:

## 1. Pr 3.17 = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback. Give the drive a step change in speed reference and monitor the

response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value

should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

2. Pr 3.17 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

- Pr 3.20 Required bandwidth,
- Pr 3.21 Required damping factor,

Pr **3.18** - Motor and load inertia. The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr **0.40**, earlier in this table).

3. Pr 3.17 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

- Pr 3.19 Required compliance angle,
- Pr 3.21 Required damping factor,

Pr **3.18** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr **0.40**, earlier in this table).

## Speed loop gains (Pr 0.07 {3.10}, Pr 0.08 {3.11}, Pr 0.09 {3.12})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 3.16. If Pr 3.16 = 0, gains Kp1, Ki1 and Kd1 (Pr 0.07 to Pr 0.09) are used, and if Pr 3.16 = 1, gains Kp2, Ki2 and Kd2 (Pr 3.13 to Pr 3.15) are used. Pr 3.16 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 3.17.

## Proportional gain (Kp), Pr 0.07 {3.10} and Pr 3.13

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the closed-loop stability limit is reached.

## Integral gain (Ki), Pr 0.08 {3.11} and Pr 3.14

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application.

## Differential gain (Kd), Pr 0.09 {3.12} and Pr 3.15

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are three methods of tuning the speed loop gains dependant on the setting of Pr 3.17:

## 1. Pr 3.17 = 0. User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback. Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope. The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly. The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly. It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown. The diagram shows the effect of incorrect P and I gain settings as well as the ideal response. 2. Pr 3.17 = 1. Bandwidth set-up If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly: Pr 3.20 - Required bandwidth, Pr 3.21 - Required damping factor, Pr 5.32 - Motor torque per amp (Kt). Pr 3.18 - Motor and load inertia. The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table). 3. Pr 3.17 = 2, Compliance angle set-up If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly: Pr 3.19 - Required compliance angle, Pr 3.21 - Required damping factor. Pr 5.32 - Motor torque per amp (Kt).

Pr 3.18 - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table)

## 8.2 Maximum motor rated current

The maximum motor rated current allowed by the drive is greater than the maximum Heavy Duty current rating in Pr **11.32**. The ratio between the Normal Duty rating and the Heavy Duty rating (Pr **11.32**) varies between drive sizes. The values for the Normal and Heavy Duty rating can be found in section 2.1 *Ratings* on page 11section 3.2 *Operating modes* on page 17.

If the motor rated current (Pr **0.46**) is set above the maximum Heavy Duty current rating (Pr **11.32**), the current limits and the motor thermal protection scheme are modified (see *section 8.3 Current limits* and *section 8.4 Motor thermal protection*, for more information).

## 8.3 Current limits

The default settings for the current limit parameters for sizes 0 to 5 are:

- 165% x motor rated current for open loop mode
- 175% x motor rated current for closed loop vector and servo modes (except SP2403 which is 150.1% for open loop, 175% for closed loop vector and 161.2% for servo).

The default settings for the current limit parameters for Unidrive SP size 6 are:

- 138.1% x motor rated current for open loop mode
- 165.7% x motor rated current for closed loop vector mode
- 150% x motor rated current for servo mode

There are three parameters which control the current limits:

- Motoring current limit: power flowing from the drive to the motor
- Regen current limit: power flowing from the motor to the drive
- Symmetrical current limit: current limit for both motoring and regen operation

The lowest of either the motoring and regen current limit, or the symmetrical current limit applies.

The maximum setting of these parameters depends on the values of motor rated current, drive rated current and the power factor.

Increasing the motor rated current (Pr **0.46/5.07**) above the Heavy Duty rating (default value), will automatically reduce the current limits in Pr **4.05** to Pr **4.07**. If the motor rated current is then set to or below the Heavy Duty rating, the current limits will be left at their reduced values.

The drive can be oversized to permit a higher current limit setting to provide higher accelerating torque as required up to a maximum of 1000%.

## 8.4 Motor thermal protection

The drive models the temperature of the motor using the motor rated current (Pr **5.07**), the thermal time constant (Pr **4.15**), whether low speed thermal protection mode has been enabled (Pr **4.25**) and the actual current flowing at any point in time. Pr **4.19** gives the estimated motor temperature as a percentage of maximum temperature.

The temperature of the motor (Pr 4.19) as a percentage of maximum temperature, with a constant current magnitude of I, constant value of K and constant value of Motor rated current (Pr 5.07) after time t is given by:

Percentage motor temperature (Pr **4.19**) =  $[I^2 / (K \times Motor rated current)^2] (1 - e^{-t/\tau}) \times 100\%$ 

This assumes that the maximum allowed motor temperature is produced by K x Motor rated current and that  $\tau$  is the thermal time constant of the point in the motor that reaches its maximum allowed temperature first.  $\tau$  is defined by Pr **4.15**. If Pr **4.15** has a value between 0.0 and 1.0 the thermal time constant is taken as 1.0.

The value of K is defined as shown in Figure 8-1 and Figure 8-2.

For both Heavy and Normal duty ratings, Pr **4.25** can be used to select two alternative protection characteristics.

Figure 8-1 Motor thermal protection (Heavy Duty)

If Pr **4.25** is 0 the characteristic is for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If Pr **4.25** is 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below 50% of base speed/ frequency. The maximum value for K is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105% current.

Both settings of Pr **4.25** are intended for motors where the cooling effect of the motor fan reduces with reduced motor speed, but with different speeds below which the cooling effect is reduced. If Pr **4.25** is 0 the characteristic is intended for motors where the cooling effect reduces with motor speed below 15% of base speed/frequency. If Pr **4.25** is 1 the characteristic is intended for motors where the cooling effect reduces with motor speed below 50% of base speed/frequency. The maximum value for K is 1.01, so that above the knee of the characteristics the motor can operate continuously up to 101% current.

When the estimated temperature in Pr **4.19** reaches 100% the drive takes some action depending on the setting of Pr **4.16**. If Pr **4.16** is 0, the drive trips when Pr **4.19** reaches 100%. If Pr **4.16** is 1, the current limit is reduced to (K - 0.05) x 100% when Pr **4.19** reaches 100%. The current limit is set back to the user defined level when Pr **4.19** falls below 95%. The thermal model temperature accumulator is reset to zero at power-up and accumulates the temperature of the motor while the drive remains powered-up. If the rated current defined by Pr **5.07** is altered, the accumulator is reset to zero.

The default setting of the thermal time constant (Pr **4.15**) is 89s for an induction motor (open loop and closed loop vector), which is equivalent to an overload of 150% for 60s from cold. The default value for a servo motor is 20s, which is equivalent to an overload of 175% for 9s from cold.

The time for the drive to trip from cold with constant motor current is given by:

T<sub>trip</sub> = -(Pr **4.15**) x ln(1 - (K x Pr **5.07** / Pr **4.01**)<sup>2</sup>)

| Information Installation Installation Started parameters the motor optimization operation PLC parameters Data Diagnostics Information | Safety<br>Information | Product<br>Information | Mechanical<br>Installation | Electrical<br>Installation | Getting<br>Started | Basic<br>parameters | Running the motor | Optimization | SMARTCARD operation | PI C | Advanced parameters |  | Diagnostics | UL Listing<br>Information |
|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------|------------------------|----------------------------|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|------|---------------------|--|-------------|---------------------------|
|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------|------------------------|----------------------------|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|------|---------------------|--|-------------|---------------------------|

Alternatively the thermal time constant can be calculated from the trip time with a given current from:

 $Pr 4.15 = -T_{trip} / ln(1 - (K / Overload)^2)$ 

The maximum value for the thermal time constant can be increased up to a maximum value of 3000s to allow an increased overload if the motor thermal characteristics permit.

For applications using Dynamics Unimotors the thermal time constants can be found in the Unimotor manual.

## 8.5 Switching frequency

The default switching frequency is 3kHz (6kHz in Servo mode), however this can be increased up to a maximum of 16kHz by Pr **5.18** (dependent on drive size). The available switching frequencies are shown below.

| Drive<br>size | Model              | 3kHz | 4kHz | 6kHz | 8kHz         | 12kHz | 16kHz |

| Table 8-1 Av | ailable switching | frequencies |
|--------------|-------------------|-------------|
|--------------|-------------------|-------------|

If switching frequency is increased from 3kHz the following apply:

- Increased heat loss in the drive, which means that derating to the output current must be applied.
   See the derating tables for switching frequency and ambient temperature in section 12.1.1 *Power and current ratings (Derating for switching frequency and temperature)* on page 258.
- 2. Reduced heating of the motor due to improved output waveform quality.
- 3. Reduced acoustic noise generated by the motor.
- 4. Increased sample rate on the speed and current controllers. A trade off must be made between motor heating, drive heating and the demands of the application with respect to the sample time required.

# 8.6 High speed operation

## 8.6.1 Encoder feedback limits

The maximum encoder frequency should be prevented from exceeding 500kHz (or 410kHz for software V01.06.00 and earlier). In closed loop and servo modes the maximum speed that can be entered in to the speed reference clamps (Pr **1.06** and Pr **1.07**) can be limited by the drive. This is defined by the following (subject to an absolute maximum of 40,000rpm):

Maximum speed limit (rpm) =  $\frac{500 \text{kHz} \times 60}{500 \text{kHz} \times 60}$ 

$$= \frac{3.0 \times 10^7}{\text{ELPR}}$$

Where:

ELPR is the equivalent encoder lines per revolution and is the number of lines that would be produced by a quadrature encoder.

- Quadrature encoder ELPR = number of lines per revolution
- F and D encoder ELPR = number of lines per revolution / 2
- SINCOS encoder ELPR = number of sine waves per revolution

This maximum speed limit is defined by the device selected with the speed feedback selector (Pr **3.26**), and the ELPR set for the position feedback device. In closed-loop vector mode it is possible to disable this limit via Pr **3.24**, so that the drive can be switched between operation with and without feedback when the speed becomes too high for the feedback device. The maximum speed limit is defined as above when Pr **3.24** = 0 or 1, and is 40,000rpm when Pr **3.24** = 2 or 3.

## 8.6.2 Field weakening (constant power) operation

(Open loop and closed loop vector mode only)

The drive can be used to run an induction machine above synchronous speed into the constant power region. The speed continues to increase and the available shaft torque reduces. The characteristics below show the torque and output voltage characteristics as the speed is increased above the rated value.

Care must be taken to ensure the torque available above base speed is sufficient for the application to run satisfactorily.

The saturation breakpoint parameters (Pr **5.29** and Pr **5.30**) found during the autotune in closed loop vector mode ensure the magnetising current is reduced in the correct proportion for the specific motor. (In open loop mode the magnetising current is not actively controlled.)

## 8.6.3 Servo high speed operation

High speed servo mode is enabled by setting Pr **5.22** =1. Care must be taken when using this mode with servo motors to avoid damaging the drive. The voltage produced by the servo motor magnets is proportional to speed. For high speed operation the drive must apply currents to the motor to counter-act the flux produced by the magnets. It is possible to operate the motor at very high speeds that would give a very high motor terminal voltage, but this voltage is prevented by the action of the drive.

| Safety         Product         Mechanical         Electrical         Getting         Basic         Running         Optimization           Information         Installation         Installation         Started         parameters         the motor         Optimization | n SMARTCARD Onboard Advanced Technical Diagnostics UL Listing Information |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|

If however, the drive is disabled (or tripped) when the motor voltages would be higher than the rating of the drive without the currents to counter-act the flux from the magnets, it is possible to damage the drive. If high speed mode is enabled the motor speed must be limited to the levels given in the table below unless an additional hardware protection system is used to limit the voltages applied to the drive output terminals to a safe level.

| Drive<br>voltage<br>rating | Maximum motor speed<br>(rpm) | Maximum safe line to line<br>voltage at the motor<br>terminals (V rms) |
|----------------------------|------------------------------|------------------------------------------------------------------------|
| 200                        | 400 x 1000 / (Ke x √2)       | 400 / √2                                                               |
| 400                        | 800 x 1000 / (Ke x √2)       | 800 / √2                                                               |
| 575                        | 955 x 1000 / (Ke x √2)       | 955 / √2                                                               |
| 690                        | 1145 x 1000 / (Ke x √2)      | 1145 / √2                                                              |

Ke is the ratio between r.m.s. line to line voltage produced by the motor and the speed in V/1000rpm. Care must also be taken not to demagnetize the motor. The motor manufacturer should always be consulted before using this mode.

## 8.6.4 Switching frequency

With a default switching frequency of 3 kHz the maximum output frequency should be limited to 250 Hz. Ideally a minimum ratio of 12:1 should be maintained between the output frequency and the switching frequency. This ensures the number of switchings per cycle is sufficient to ensure the output waveform quality is maintained at a minimum level. If this is not possible, quasi-square switching should be enabled (Pr **5.20** =1). The output waveform will be quasi square above base speed ensuring a symmetrical output waveform, which results in a better quality output than would otherwise result.

## 8.6.5 Maximum speed / frequency

In open loop mode the maximum frequency is 3,000 Hz.

In closed loop vector mode the maximum output frequency is 600 Hz.

In servo mode the maximum output frequency is 1250Hz, however the speed is limited by the voltage constant (Ke) of the motor. Ke is a specific constant for the servo motor being used. It can normally be found on the motor data sheet in V/krpm (volts per 1,000rpm).

## 8.6.6 Quasi-Square wave (open-loop only)

The maximum output voltage level of the drive is normally limited to an equivalent of the drive input voltage minus voltage drops within the drive (the drive will also retain a few percent of the voltage in order to maintain current control). If the motor rated voltage is set at the same level as the supply voltage, some pulse deletion will occur as the drive output voltage approaches the rated voltage level. If Pr **5.20** (Quasi-square wave enable) is set to 1 the modulator will allow over modulation, so that as the output frequency increases beyond the rated frequency the voltage continues to increase above the rated voltage. The modulation depth will increase beyond unity; first producing trapezoidal and then quasi-square waveforms.

This can be used for example:

 To obtain high output frequencies with a low switching frequency which would not be possible with space vector modulation limited to unity modulation depth,

or

• In order to maintain a higher output voltage with a low supply voltage.

The disadvantage is that the machine current will be distorted as the modulation depth increases above unity, and will contain a significant amount of low order odd harmonics of the fundamental output frequency. The additional low order harmonics cause increased losses and heating in the motor.

# 9 SMARTCARD operation

## 9.1 Introduction

This is a standard feature that enables simple configuration of parameters in a variety of ways. The SMARTCARD can be used for:

- Parameter copying between drives
- Saving whole drive parameter sets
- Saving 'differences from default' parameter sets
- Storing Onboard PLC programs
- Automatically saving all user parameter changes for maintenance purposes
- Loading complete motor map parameters

## Size 0

When inserting the SMARTCARD, always ensure that ST SP0 arrow points upwards.

## Size 1 to 6

The SMARTCARD is located at the top of the module under the drive display (if installed) on the left-hand side. Ensure the SMARTCARD is inserted with the SP1-9 arrow pointing upwards.

The drive only communicates with the SMARTCARD when commanded to read or write, meaning the card may be "hot swapped".

## Encoder phase angle (servo mode only)

With drive software version V01.08.00 onwards, the encoder phase angles in Pr **3.25** and Pr **21.20** are copied to the SMARTCARD when using any of the SMARTCARD transfer methods.

With drive software version V01.05.00 to V01.07.01, the encoder phase angles in Pr **3.25** and Pr **21.20** are only copied to the SMARTCARD when using either Pr **0.30** set to Prog (2) or Pr **xx.00** set to 3yyy.

This is useful when the SMARTCARD is used to back-up the parameter set of a drive but caution should be used if the SMARTCARD is used to transfer parameter sets between drives. Unless the encoder phase angle of the servo motor connected to the destination drive is known to be the same as the servo motor connected to the source drive, an autotune should be performed or the encoder phase angle should be entered manually into Pr 3.25 (or Pr 21.20). If the encoder phase angle is incorrect the drive may lose control of the motor resulting in an O.SPd or Enc10 trip when the drive is enabled. With drive software version V01.04.00 and earlier, or when using software version V01.05.00 to V01.07.01 and Pr xx.00 set to 4yyy is used, then the encoder phase angles in Pr 3.25 and Pr 21.20 are not copied to the SMARTCARD. Therefore, Pr 3.25 and Pr 21.20 in the destination would not be changed during a transfer of this data block from the SMARTCARD.

## Figure 9-1 Installation of the SMARTCARD

The SMARTCARD has 999 individual data block locations. Each individual location from 1 to 499 can be used to store data until the capacity of the SMARTCARD is used. With software V01.07.00 and later the drive can support SMARTCARDs with a capacity of between 4kB and 512kB. With software V01.06.02 and earlier the drive can support SMARTCARDs with a capacity of 4kB.

The data block locations of the SMARTCARD are arranged to have the following usage:

#### Table 9-1 SMARTCARD data blocks

| Data Block | Туре         | Example Use         |
|------------|--------------|---------------------|
| 1 to 499   | Read / Write | Application set ups |
| 500 to 999 | Read Only    | Macros              |

'Differences from default' parameter sets will be much smaller than whole parameter sets and thus take up a lot less memory as most applications only require a few parameters to be changed from the default setting.

The whole card may be protected from writing or erasing by setting the read-only flag as detailed section 9.2.9 *9888 / 9777 - Setting and clearing the SMARTCARD read only flag* on page 146.

Data transfer to or from the SMARTCARD is indicated by one the following:

- SM-Keypad/SP0 Keypad: The decimal point after the fourth digit in the upper display will flash.
- SM-Keypad Plus: The symbol 'CC' will appear in the lower left hand corner of the display

The card should not be removed during data transfer, as the drive will produce a trip. If this occurs then either the transfer should be reattempted or in the case of a card to drive transfer, default parameters should be loaded.

## 9.2 Transferring data

Data transfer, erasing and protecting the information is performed by entering a code in Pr **xx.00** and then resetting the drive as shown in Table 9-2.

## Table 9-2 SMARTCARD codes

| Code | Action                                                                                                          |
|------|-----------------------------------------------------------------------------------------------------------------|
| 2001 | Transfer drive parameters as difference from defaults to a<br>bootable SMARTCARD block in data block number 001 |
| Зууу | Transfer drive parameters to a SMARTCARD block number yyy                                                       |
| 4ууу | Transfer drive data as difference from defaults to SMARTCARD block number yyy                                   |
| 5ууу | Transfer drive Onboard PLC program to SMARTCARD block number yyy                                                |
| бууу | Transfer SMARTCARD data block yyy to the drive                                                                  |

| 9555 | Clear SMARTCARD warning suppression flag (V01.07.00 and later)                                                  |
| 9666 | Set SMARTCARD warning suppression flag (V01.07.00 and<br>later)                                                 |
| 9777 | Clear SMARTCARD read-only flag                                                                                  |
| 9888 | Set SMARTCARD read-only flag                                                                                    |
| 9999 | Erase SMARTCARD                                                                                                 |

Where yyy indicates the block number 001 to 999. See Table 9-1 for restrictions on block numbers.

## NOTE

If the read only flag is set then only codes 6yyy or 9777 are effective.

## 9.2.1 Writing to the SMARTCARD

**3yyy - Transfer data to the SMARTCARD** The data block contains the complete parameter data from the drive, i.e. all user save (US) parameters except parameters with the NC coding bit set. Power-down save (PS) parameters are not transferred to the SMARTCARD.

With software V01.06.02 and earlier, a save must have been performed on the drive to transfer the parameters from the drive RAM to the EEPROM before the transfer to the SMARTCARD is carried out.

### 4yyy - Write default differences to a SMARTCARD

The data block only contains the parameter differences from the last time default settings were loaded.

Six bytes are required for each parameter difference. The data density is not as high as when using the 3yyy transfer method as described in the previous section, but in most cases the number of differences from default is small and the data blocks are therefore smaller. This method can be used for creating drive macros. Power-down save (PS) parameters are not transferred to the SMARTCARD.

The data block format is different depending on the software version. The data block holds the following parameters:

#### Software V01.06.02 and earlier

All user save (US) parameters, except those with the NC (Not copied) coding bit set or those that do not have a default value, can be transferred to the SMARTCARD.

#### Software V01.07.xx

All user save (US) parameters, except those with the NC (Not copied) coding bit set or those that do not have a default value, can be transferred to the SMARTCARD. In addition to these parameters all menu 20 parameters (except Pr **20.00**), can be transferred to the SMARTCARD even though they are not user save parameters and have the NC coding bit set.

#### Software V01.08.00 onwards

All user save (US) parameters including those that do not have a default value (i.e. Pr **3.25** or Pr **21.20** *Encoder phase angle*), but not including those with the NC (Not copied) coding bit set can be transferred to the SMARTCARD. In addition to these parameters all menu 20 parameters (except Pr **20.00**), can be transferred to the SMARTCARD even though they are not user save parameters and have the NC coding bit set.

It is possible to transfer parameters between drives with each of the different formats, however, the data block compare function does not work with data produced by different formats.

## Writing a parameter set to the SMARTCARD (Pr 11.42 = Prog (2))

Setting Pr **11.42** to Prog (2) and resetting the drive will save the parameters to the SMARTCARD, i.e. this is equivalent to writing 3001 to Pr **xx.00**. All SMARTCARD trips apply except 'C.Chg'. If the data block already exists it is automatically overwritten. When the action is complete this parameter is automatically reset to nonE (0).

### 9.2.2 Reading from the SMARTCARD 6yyy - Read default differences from a SMARTCARD

When the data is transferred back to a drive, using 6yyy in Pr **xx.00**, it is transferred to the drive RAM and the drive EEPROM. A parameter save is not required to retain the data after power-down. Set up data for any Solutions Modules installed are stored on the card and are transferred to the destination drive. If the Solutions Modules are different between the source and destination drive, the menus for the slots where the Solutions Module categories are different are not updated from the card and will contain their default values after the copying action. The drive will produce a 'C.Optn' trip if the Solutions Modules installed to the source and destination drive are different or are in different slots. If the data is being transferred to a drive of a different voltage or current rating a 'C.rtg' trip will occur.

The following drive rating dependant parameters (RA coding bit set) will not be transferred to the destination drive by a SMARTCARD when the rating of the destination drive is different from the source drive and the file is a parameter file (i.e. created using the 3yyy transfer method). However, with software V01.09.00 and later drive rating dependent parameters will be transferred if only the current rating is different and the file is a differences from default type file (i.e. created using the 4yyy transfer method). If drive rating dependant parameters are not transferred to the destination drive they will contain their default values.

| Pr 6.48 Line power supply loss ride through detection level |

## Reading a parameter set from the SMARTCARD (Pr 11.42 = rEAd (1))

Setting Pr **11.42** to rEAd (1) and resetting the drive will transfer the parameters from the card into the drive parameter set and the drive EEPROM, i.e. this is equivalent to writing 6001 to Pr **xx.00**. All SMARTCARD trips apply. Once the parameters are successfully copied this parameter is automatically reset to nonE (0). Parameters are saved to the drive EEPROM after this action is complete.

#### NOTE

This operation is only performed if data block 1 on the card is a full parameter set (3yyy transfer) and not a default difference file (4yyy transfer). If block 1 does not exist a 'C.dAt' trip occurs.

## 9.2.3 Auto saving parameter changes (Pr 11.42 = Auto (3))

This setting causes the drive to automatically save any changes made to menu 0 parameters on the drive to the SMARTCARD. The latest menu 0 parameter set in the drive is therefore always backed up on the SMARTCARD. Changing Pr **11.42** to Auto (3) and resetting the drive will immediately save the complete parameter set from the drive to the card, i.e. all user save (US) parameters except parameters with the NC coding bit set. Once the whole parameter set is stored only the individual modified menu 0 parameter setting is updated.

Advanced parameter changes are only saved to the card when Pr **xx.00** is set to a 1000 and the drive reset.

All SMARTCARD trips apply, except 'C.Chg'. If the data block already contains information it is automatically overwritten.

If the card is removed when Pr 11.42 is set to 3 Pr 11.42 is then automatically set to nonE (0).

When a new SMARTCARD is installed Pr **11.42** must be set back to Auto (3) by the user and the drive reset so the complete parameter set is rewritten to the new SMARTCARD if auto mode is still required.

When Pr **11.42** is set to Auto (3) and the parameters in the drive are saved, the SMARTCARD is also updated, therefore the SMARTCARD becomes a copy of the drives stored configuration.

At power up, if Pr **11.42** is set to Auto (3), the drive will save the complete parameter set to the SMARTCARD. The drive will display 'cArd' during this operation. This is done to ensure that if a user puts a new SMARTCARD in during power down the new SMARTCARD will have the correct data.

### NOTE

When Pr **11.42** is set to Auto (3) the setting of Pr **11.42** itself is saved to the drive EEPROM but NOT to the SMARTCARD.

## 9.2.4 Booting up from the SMARTCARD on every power up (Pr 11.42 = boot (4))

When Pr **11.42** is set to boot (4) the drive operates the same as Auto mode except when the drive is powered-up. The parameters on the SMARTCARD will be automatically transferred to the drive at power up if the following are true:

- A card is inserted in the drive
- Parameter data block 1 exists on the card
- The data in block 1 is type 1 to 5 (as defined in Pr 11.38)
- Pr 11.42 on the card set to boot (4)

The drive will display 'boot' during this operation. If the drive mode is different from that on the card, the drive gives a 'C.Typ'. trip and the data is not transferred.

If 'boot' mode is stored on the copying SMARTCARD this makes the copying SMARTCARD the master device. This provides a very fast and efficient way of re-programming a number of drives.

| ſ | Safety<br>Information | Product<br>Information | Mechanical<br>Installation | Electrical<br>Installation | Getting<br>Started | Basic<br>parameters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |
|---|-----------------------|------------------------|----------------------------|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|   |                       | monuation              | motanation                 | motanation                 | 0101100            | parametere          |                   |              | oporation           | . 20           | paramotoro          | Data              |             | momanon                   |

If data block 1 contains a bootable parameter set and data block 2 contains an Onboard PLC program (type 17 as defined in Pr **11.38**), then if the drive software version is V01.07.00 and later, the onboard PLC program will be transferred to the drive at power up along with the parameter set in data block 1.

### NOTE

'Boot' mode is saved to the card, but when the card is read, the value of Pr **11.42** is not transferred to the drive.

#### 9.2.5 Booting up from the SMARTCARD on every power up (Pr xx.00 = 2001), software V01.08.00 and later

It is possible to create a difference from default bootable file by setting Pr **xx.00** to 2001 and resetting the drive. This type of file causes the drive to behave in the same way at power-up as a file created with boot mode set up with Pr **11.42**. The difference from the default file is that it has the added advantage of including menu 20 parameters.

Setting Pr **xx.00** to 2001 will overwrite data block 1 on the card if it already exists.

If a data block 2 exists and contains an Onboard PLC program (type 17 as defined in Pr 11.38), this will also be loaded after the parameters have been transferred

A bootable difference from default file can only be created in one operation and parameters cannot be added as they are saved via menu 0.

## 9.2.6 8yyy - Comparing the drive full parameter set with the SMARTCARD values

Setting 8yyy in Pr **xx.00**, will compare the SMARTCARD file with the data in the drive. If the compare is successful Pr **xx.00** is simply set to 0. If the compare fails a 'C.cpr' trip is initiated.

### 9.2.7 7yyy / 9999 - Erasing data from the SMARTCARD

Data can be erased from the SMARTCARD either one block at a time or all blocks in one go.

- Setting 7yyy in Pr xx.00 will erase SMARTCARD data block yyy.
- Setting 9999 in Pr xx.00 will erase all SMARTCARD data blocks

### 9.2.8 9666 / 9555 - Setting and clearing the SMARTCARD warning suppression flag (V01.07.00 and later)

If the Solutions Modules installed to the source and destination drive are different or are in different slots the drive will produce a 'C.Optn' trip. If the data is being transferred to a drive of a different voltage or current rating a 'C.rtg' trip will occur. It is possible to suppress these trips by setting the warning suppression flag. If this flag is set the drive will not trip if the Solutions Module(s) or drive ratings are different between the source and destination drives. The Solutions Module or rating dependent parameters will not be transferred.

- Setting 9666 in Pr xx.00 will set the warning suppression flag
- Setting 9555 in Pr xx.00 will clear the warning suppression flag

### 9.2.9 9888 / 9777 - Setting and clearing the SMARTCARD read only flag

The SMART CARD may be protected from writing or erasing by setting the read only flag. If an attempt is made to write or erase a data block when the read only flag is set, a 'C.rdo' trip is initiated. When the read only flag is set only codes 6yyy or 9777 are effective.

- Setting 9888 in Pr xx.00 will set the read only flag
- Setting 9777 in Pr xx.00 will clear the read only flag.

### 9.3 Data block header information

Each data block stored on a SMARTCARD has header information detailing the following:

- A number which identifies the block (Pr 11.37)
- The type of data stored in the block (Pr 11.38)
- The drive mode if the data is parameter data (Pr 11.38)
- The version number (Pr **11.39**)
- The checksum (Pr 11.40)
- The read-only flag
- The warning suppression flag (V01.07.00 and later)

The header information for each data block which has been used can be viewed in Pr **11.38** to Pr **11.40** by increasing or decreasing the data block number set in Pr **11.37**.

### Software V01.07.00 and later

If Pr **11.37** is set to 1000 the checksum parameter (Pr **11.40**) shows the number of 16 byte pages left on the card.

If Pr **11.37** is set to 1001 the checksum parameter (Pr **11.40**) shows the total capacity of the card in 16 byte pages. Therefore, for a 4kB card this parameter would show 254.

If Pr **11.37** is set to 1002 the checksum parameter (Pr **11.40**) shows the state of the read-only (bit 0) and warning suppression flags (bit 1).

Software version V01.11.00 and later: If Pr **11.37** is set to 1003, the checksum parameter (Pr **11.40**) shows the product identifier (255 = Unidrive SP, 1 = Commander GP20, 2 = Digitax ST, 3 = Affinity).

If there is no data on the card Pr **11.37** can only have values of 0 or 1000 to 1003.

### Software V01.06.02 and earlier

If Pr **11.37** is set to 1000 the checksum parameter (Pr **11.40**) shows the number of bytes left on the card. If there is no data on the card Pr **11.37** can only have values of 0 or 1000.

The version number is intended to be used when data blocks are used as drive macros. If a version number is to be stored with a data block, Pr **11.39** should be set to the required version number before the data is transferred. Each time Pr **11.37** is changed by the user the drive puts the version number of the currently viewed data block in Pr **11.39**.

If the destination drive has a different drive mode to the parameters on the card, the drive mode will be changed by the action of transferring parameters from the card to the drive.

The actions of erasing a card, erasing a file, changing a menu 0 parameter, or inserting a new card will effectively set Pr **11.37** to 0 or the lowest file number in the card.

### 9.4 SMARTCARD parameters

### Table 9-3 Key to parameter table coding

| RW | Read / Write     | RO  | Read only     | Uni | Unipolar    |
|----|------------------|-----|---------------|-----|-------------|
| Bi | Bi-polar         | Bit | Bit parameter | Txt | Text string |
| FI | Filtered         | DE  | Destination   | NC  | Not copied  |
| RA | Rating dependent | PT  | Protected     | US  | User save   |
| PS | Power down save  |     |               |     |             |

| 11. | .36 {0.29} SMARTCARD para |     |  |  |  |   | er c | lata pre | eviousl | y loade | ed |
|-----|---------------------------|-----|--|--|--|---|------|----------|---------|---------|----|

NOTE

If Pr **11.42** is equal to 1 or 2, this value is not transferred to the drive or saved to the EEPROM. If Pr **11.42** is set to a 3 or 4 the value is transferred.

nonE (0) = Inactive

rEAd (1) = Read parameter set from the SMARTCARD

Prog (2) = Programming a parameter set to the SMARTCARD

Auto (3) = Auto save

boot (4) = Boot mode

### 9.5 SMARTCARD trips

After an attempt to read, write or erase data to or from a SMARTCARD a trip may occur if there has been a problem with the command. The following trips indicate various problems as detailed in Table 9-4.

### Table 9-4 Trip conditions

| C.Acc SMARTCARD trip: SMARTCARD Read / Write fail<br>Check SMARTCARD is installed / located correctly<br>Ensure SMARTCARD is installed / located correctly<br>Replace SMARTCARD is more writing data to data location 500 to 999<br>Replace SMARTCARD bit of the menu 0 parameter modification cannot be saved to the SMARTCARD because the necessary file has<br>not been created on the SMARTCARD<br>A write to a menu 0 parameter modification cannot be saved to the SMARTCARD because the necessary file on the<br>SMARTCARD has not been created<br>Ensure that Pt 11.42 is correctly set and reset the drive to create the necessary file on the SMARTCARD<br>Re-attempt the parameter write to the menu 0 parameter<br>C.bUSY<br>SMARTCARD trip: SMARTCARD can not perform the required function as it is being accessed by a Solutions Module<br>178<br>Wait for the Solutions Module to finish accessing the SMARTCARD and then re-attempt the required function<br>C.Chg<br>SMARTCARD trip: Data location already contains data<br>179<br>Erase data in data location<br>Write data to an alternative data location<br>C.Cpr<br>SMARTCARD trip: Data location specified does not contain any data<br>183<br>Ensure data block number is correct<br>C.Fr<br>SMARTCARD trip: SMARTCARD full<br>184<br>Delete a data block number is correct<br>C.Full<br>SMARTCARD trip: SMARTCARD full<br>184<br>Delete a data block or use a different SMARTCARD<br>C.Cput SMARTCARD trip: SMARTCARD full<br>184<br>Delete a data block or use a different SMARTCARD<br>C.Cput SMARTCARD trip: SMARTCARD full<br>184<br>Delete a data block or use a different SMARTCARD<br>C.Prod<br>SMARTCARD trip: SMARTCARD by setting Pr xx.00 to 9999 and pressing the rel <sup>®</sup> reset button<br>C.Prod<br>SMARTCARD trip: The data blocks on the SMARTCARD are not compatible with this product<br>175<br>Erase all data on the SMARTCARD by setting Pr xx.00 to 9999 and pressing the rel <sup>®</sup> reset button<br>Replace SMARTCARD trip: SMARTCARD by setting Pr xx.00 to 9999 and pressing the rel <sup>®</sup> reset button<br>Replace SMARTCARD trip: SMARTCARD by setting Pr xx.00 to 9999 and pressing the rel <sup>®</sup> reset button<br>Replace SM | Trip   | Diagnosis                                                                                                                              |

# 10 Onboard PLC

### 10.1 Onboard PLC and SYPTLite

The drive has the ability to store and execute a 4KB Onboard PLC ladder logic program without the need for additional hardware in the form of a Solutions Module.

The ladder logic program is written using SYPTLite, a Windows<sup>™</sup> based ladder diagram editor allowing the development of programs for execution in Unidrive SP or SM-Applications Lite.

SYPTLite is designed to be easy to use and to make program development as simple as possible. The features provided are a sub-set of those in the SYPT program editor. SYPTLite programs are developed using ladder logic, a graphical language widely used to program PLCs (IEC61131-3). SYPTLite allows the user to "draw" a ladder diagram representing a program.

SYPTLite provides a complete environment for the development of ladder diagrams. Ladder diagrams can be created, compiled into user programs and downloaded to a Unidrive SP or SM-Applications Lite for execution, via the RJ45 serial communications port on the front of the drive. The run-time operation of the compiled ladder diagram on the target can also be monitored using SYPTLite and facilities are provided to interact with the program on the target by setting new values for target parameters.

SYPTLite is available on the CD which is supplied with the drive.

### 10.2 Benefits

The combination of the Onboard PLC and SYPTLite, means that the drive can replace nano and some micro PLCs in many applications. The Onboard PLC programs can consist of up to a maximum of 50 ladder logic rungs (up to 7 function blocks and 10 contacts per rung). The Onboard PLC program can also be transferred to and from a SMARTCARD for backup or quick commissioning/start-up

In addition to the basic ladder symbols, SYPTLite contains a sub-set of the function from the full version of SYPT. These include,

- Arithmetic blocks
- Comparison blocks
- Timers
- Counters
- Multiplexers
- Latches

Bit manipulation

Typical applications for the Onboard PLC include,

- Ancillary pumps
- Fans and control valves
- Interlocking logic
- Sequences routines
- Custom control words.

### 10.3 Limitations

Compared with the Applications Modules (SM-Applications, SM-Applications Lite and SM-Applications Plus) when programmed with SYPT, the Onboard PLC program has the following limitations:

- The maximum program size is 4032 bytes including header and optional source code.
- The drive is rated for 100 program downloads. This limitation is imposed by the flash memory used to store the program within the drive.
- The user cannot create user variables. The user is only able to manipulate the drive parameter set.
- The program cannot be downloaded or monitored over CTNet. The program is only accessible via the drives RJ45 serial communications port.
- There are no real-time tasks, i.e. the scheduling rate of the program cannot be guaranteed. Applications Modules tasks such as Clock, Event, Pos0 or Speed are not available. The Onboard PLC should

not be used for time-critical applications. For time-critical applications Unidrive SP and an SM-Applications Plus, SM-Applications or SM-Applications Lite should be used.

 The program runs at a low priority. The drive provides a single background task in which to run a ladder diagram. The drive is prioritised to perform its major functions first, e.g. motor control, and will use any remaining processing time to execute the ladder diagram as a background activity. As the drive's processor becomes more heavily loaded, less time is spent executing the program.

### Figure 10-1 Onboard PLC program scheduling

The user program is scheduled for a short period approximately once every 64ms. The time for which the program is scheduled will vary between 0.2ms and 2ms depending on the loading of the drive's processor.

When scheduled, several scans of the user program may be performed. Some scans may execute in microseconds. However, when the main drive functions are scheduled there will be a pause in the execution of the program causing some scans to take many milliseconds. SYPTLite displays the average execution time calculated over the last 10 scans of the user program.

| Safety<br>Information | Product<br>Information | Mechanical<br>Installation | Electrical<br>Installation | Getting<br>Started | Basic<br>parameters | Running the motor | Optimization | SMARTCARD operation | Onboard<br>PLC | Advanced parameters | Technical<br>Data | Diagnostics | UL Listing<br>Information |
|-----------------------|------------------------|----------------------------|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|
|-----------------------|------------------------|----------------------------|----------------------------|--------------------|---------------------|-------------------|--------------|---------------------|----------------|---------------------|-------------------|-------------|---------------------------|

The Onboard PLC and SYPTLite form the first level of functionality in a range of programmable options for Unidrive SP.

Figure 10-2 Programming options for Unidrive SP

SYPTLite can be used with either the Onboard PLC in the Unidrive SP or with SM-Applications Lite to create ladder logic programs.

SYPT can be used with any of the Applications Modules to create fully flexible programs using ladder logic, function blocks or DPL script.

### 10.4 Getting started

SYPTLite can be found on the CD which is supplied with the drive.

### SYPTLite system requirements

- Windows 2000/XP/Vista. Windows 95/98/98SE/Me/NT4 are not supported
- Pentium III 500MHz or better recommended
- 128MB RAM
- Minimum of 800x600 screen resolution. 1024x768 is recommended
- Adobe Acrobat 5.10 or later (for viewing User Guides)
- Microsoft Internet Explorer V5.0 or later
- RS232 to RS485, RJ45 communications lead to connect the PC to the drive
- Administrator rights are required to install the software

To install SYPTLite, insert the CD and the auto-run facility should start up the front-end screen, from which SYPTLite can be selected.

See the SYPTLite help file for more information regarding using SYPTLite, creating ladder diagrams and the available function blocks.

### 10.5 Onboard PLC parameters

The following parameters are associated with the Onboard PLC program.

|    | 11.47 Drive Onboard PLC program enable |     |        |   |  |   |  |  |   |    |  |
|----|----------------------------------------|-----|--------|---|--|---|--|--|---|----|--|
| R١ | N                                      | Uni |        |   |  |   |  |  |   | US |  |
| ţ  |                                        |     | 0 to 2 | 2 |  | ₽ |  |  | 2 |    |  |

This parameter is used to start and stop the drive Onboard PLC program.

| Value | Description                                                                                                                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Halt the drive Onboard PLC program.                                                                                                                                                                    |
| 1     | Run the drive Onboard PLC program (if installed). Any out-of-<br>range parameter writes attempted will be clipped to the<br>maximum / minimum values valid for that parameter before<br>being written. |
| 2     | Run the drive Onboard PLC program (if installed). Any out-of-<br>range parameter writes attempted will cause a 'UP ovr' trip.                                                                          |

|   | 11.48 Drive Onboard PLC program status |    |          |      |  |   |  |    |    |  |  |
|---|----------------------------------------|----|----------|------|--|---|--|----|----|--|--|
| R | О                                      | Bi |          |      |  |   |  | NC | PT |  |  |
| ţ |                                        | -' | 128 to - | +127 |  | ₽ |  |    |    |  |  |

The drive Onboard PLC program status parameter indicates to the user the actual state of the drive Onboard PLC program.

| Safety         Product         Mechanical         Electrical         Getting         Basic         Running           Information         Information         Installation         Installation         Started         parameters         the motor | Optimization MARTCARD Onboard operation PLC Advanced parameters Data Diagnostics Information |

The drive Onboard PLC programming events parameter holds the number of times an Onboard PLC program download has taken place and is 0 on dispatch from the factory. The drive is rated for one hundred ladder program downloads. This parameter is not altered when defaults are loaded.

|   | 11. | 50  | Drive    | Onboa | rd PLC | ; pr | ogra | am ave | rage s | can tim | e |
|---|-----|-----|----------|-------|--------|------|------|--------|--------|---------|---|
| R | О   | Uni |          |       |        |      |      | NC     | PT     |         |   |
| Û |     | 0 t | to 65,53 | 35 ms |        | Û    |      |        |        |         |   |

This parameter is updated once per second or once per Onboard PLC program scan whichever is the longest. If more than one program scan occurs within the one second update period the parameter shows the average scan time. If the program scan time is longer than one second the parameter shows the time for the last program scan.

|   | 11.51 Drive Onboard PLC program first run |     |          |        |  |   |  |    |    |  |  |  |  |
|---|-------------------------------------------|-----|----------|--------|--|---|--|----|----|--|--|--|--|
| R | С                                         | Bit |          |        |  |   |  | NC | PT |  |  |  |  |
| ¢ |                                           | OFI | F (0) or | On (1) |  | ⇧ |  |    |    |  |  |  |  |

The Drive Onboard PLC program first run parameter is set for the duration of program scan from the stopped state. This enables the user to perform any required initialisation every time the program is run. This parameter is set every time the program is stopped.

### 10.6 Onboard PLC trips

The following trips are associated with the Onboard PLC program.

| Trip    | Diagnosis                                                                                                                                                                          |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UP ACC  | Onboard PLC program: Cannot access Onboard PLC program file on drive                                                                                                               |

### 10.7 Onboard PLC and the SMARTCARD

The Onboard PLC program in a drive may be transferred from the drive to a SMARTCARD and vice versa.

- To transfer an Onboard PLC program from the drive to a SMARTCARD, set Pr xx.00 to 5yyy and reset the drive
- To transfer an Onboard PLC program from the SMARTCARD to a drive, set Pr **xx.00** to 6yyy and reset the drive.

(Where yyy is the data block location, see Table 9-1 *SMARTCARD data blocks* on page 144 for restrictions on block numbers).

If an attempt is made to transfer an Onboard PLC program from a drive to the SMARTCARD when the drive contains no program, the block is still created on the SMARTCARD but it will contain no data. If this data block is then transferred to a drive, the destination drive will then have no Onboard PLC program.

The smallest SMARTCARD compatible with Unidrive SP has a capacity of 4064 bytes and each block can be up to 4064 bytes in size. The maximum size of a user program is 4032 bytes so it is guaranteed that any Onboard PLC program downloaded to a Unidrive SP will fit on to an empty SMARTCARD. A SMARTCARD can contain a number of Onboard PLC programs until the capacity of the card is used.

## 11 Advanced parameters

This is a quick reference to all parameters in the drive showing units, ranges limits etc, with block diagrams to illustrate their function. Full descriptions of the parameters can be found in the *Advanced User Guide* on the supplied CD ROM.

These advanced parameters are listed for reference purposes only. The lists in this chapter do not include sufficient information for adjusting these parameters. Incorrect adjustment can affect the safety of the system, and damage the drive and or external equipment. Before attempting to adjust any of these parameters, refer to the *Advanced User Guide*.

### Table 11-1 Menu descriptions

| Menu<br>number | Description                                            |
|----------------|--------------------------------------------------------|
| 0              | Commonly used basic set up parameters for quick / easy |
| Ũ              | programming                                            |
| 1              | Frequency / speed reference                            |

| 21             | Second motor parameters                                |
| 22             | Additional Menu 0 set-up                               |

### Operation mode abbreviations:

- OL> Open loop
- CL> Closed loop (which incorporates closed loop vector and servo mode)
- VT> Closed loop vector mode
- SV> Servo

#### Default abbreviations:

EUR> European default value (50Hz AC supply frequency) USA> USA default value (60Hz AC supply frequency)

#### NOTE

Parameter numbers shown in brackets {...} are the equivalent Menu 0 parameters. Some Menu 0 parameters appear twice since their function depends on the operating mode.

The Range - CL column applies to both Closed-loop Vector and Closedloop Servo. For some parameters, this column applies only to one of these modes; this is indicated accordingly in the Default columns.

In some cases, the function or range of a parameter is affected by the setting of another parameter; the information in the lists relates to the default condition of such parameters.

#### Table 11-2 Key to parameter table coding

| Coding | Attribute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RW     | Read/write: can be written by the user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| RO     | Read only: can only be read by the user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Bit    | 1 bit parameter. 'On' or 'OFF' on the display                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Bi     | Bipolar parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Uni    | Unipolar parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Txt    | Text: the parameter uses text strings instead of numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FI     | Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.                                                                                                                                                                                                                                                                                                                                                                                      |
| DE     | Destination: This parameter selects the destination of an input or logic function.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| RA     | Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will not be transferred to the destination drive by SMARTCARDs when the rating of the destination drive is different from the source drive and the file is a parameter file. However, with software V01.09.00 and later the value will be transferred if only the current rating is different and the file is a differences from default type file. |
| NC     | Not copied: not transferred to or from SMARTCARDs<br>during copying.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PT     | Protected: cannot be used as a destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| US     | User save: parameter saved in drive EEPROM when the user initiates a parameter save.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PS     | Power-down save: parameter automatically saved in drive<br>EEPROM when the under volts (UV) trip occurs.With<br>software version V01.08.00 and later, power-down save<br>parameters are also saved in the drive when the user<br>initiates a parameter save.                                                                                                                                                                                                                                                            |

### Parameter ranges and variable maximums:

The two values provided define the minimum and maximum values for the given parameter. In some cases the parameter range is variable and dependant on either:

- other parameters
- the drive rating
- drive mode
- or a combination of these

The values given in Table 11-4 are the variable maximums used in the drive.

### Table 11-4 Definition of parameter ranges & variable maximums

| Maximum                                                                               | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| SPEED_LIMIT_MAX<br>[40000.0rpm]                                                       | Maximum applied to speed reference limits         A maximum limit may be applied to the speed reference to prevent the nominal encoder frequency from exceeding 500kHz (410kHz for software version V01.06.00 and earlier). The maximum is defined by SPEED_LIMIT_MAX (in rpm) = 500kHz x 60 / ELPR = 3.0 x 10 <sup>7</sup> / ELPR subject to an absolute maximum of 40,000 rpm.         ELPR is equivalent encoder lines per revolution and is the number of lines that would be produced by a quadrature encoder.         Quadrature encoder ELPR = number of lines per revolution         F and D encoder ELPR = number of lines per revolution / 2         Resolver ELPR = resolution / 4         SINCOS encoder ELPR = number of sine waves per revolution         Serial comms encoder ELPR = resolution / 4         This maximum is defined by the device selected with the speed feedback selector (Pr 3.26) and the ELPR set for the position feedback device.         In closed-loop vector RFC mode SPEED_LIMIT_MAX = 40,000rpm. |
| SPEED_MAX<br>[40000.0rpm]                                                             | Maximum speed<br>This maximum is used for some speed related parameters in menu 3. To allow headroom for overshoot etc. the<br>maximum speed is twice the maximum speed reference.<br>SPEED_MAX = 2 x SPEED_FREQ_MAX                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| RATED_CURRENT_MAX<br>[9999.99A]                                                       | Maximum motor rated current (Maximum Normal Duty current rating)RATED_CURRENT_MAX = $1.36 \times K_C$ .The motor rated current can be increased above $K_C$ up to a level not exceeding $1.36 \times K_C$ ). (Maximum motor rated current is the maximum normal duty current rating.)The actual level varies from one drive size to another, refer to Table 11-5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### \*Encoder phase angle (servo mode only)

With drive software version V01.08.00 onwards, the encoder phase angles in Pr **3.25** and Pr **21.20** are copied to the SMARTCARD when using any of the SMARTCARD transfer methods.

With drive software version V01.05.00 to V01.07.01, the encoder phase angles in Pr **3.25** and Pr **21.20** are only copied to the SMARTCARD when using either Pr **0.30** set to Prog (2) or Pr **xx.00** set to 3yyy.

This is useful when the SMARTCARD is used to back-up the parameter set of a drive but caution should be used if the SMARTCARD is used to transfer parameter sets between drives. Unless the encoder phase angle of the servo motor connected to the destination drive is known to be the same as the servo motor connected to the source drive, an autotune should be performed or the encoder phase angle should be entered manually into Pr 3.25 (or Pr 21.20). If the encoder phase angle is incorrect the drive may lose control of the motor resulting in an O.SPd or Enc10 trip when the drive is enabled. With drive software version V01.04.00 and earlier, or when using software version V01.05.00 to V01.07.01 and Pr xx.00 set to 4yyy is used, then the encoder phase angles in Pr 3.25 and Pr 21.20 are not copied to the SMARTCARD. Therefore, Pr 3.25 and Pr 21.20 in the destination would not be changed during a transfer of this data block from the SMARTCARD.

#### NOTE

\*\*If output voltage from the encoder is >5V, then the termination resistors must be disabled Pr **3.39** to 0.

\*For more information, refer to section 11.21.5 Stop modes on page 252.

\*\*For more information, refer to section 11.21.6 *Line power supply loss modes* on page 253.

\*\*\*For more information, refer to section 11.21.7 *Start / stop logic modes* on page 254.

\*\*\*\*For more information, refer to section 11.21.8 Catch a spinning

motor on page 255.

\*\*\*\*\*The drive thermal model system normally controls the fan speed, however the fan can be forced to operate at full speed if this parameter is set to 1. When this is set to 1 the fan remains at full speed until 10s after this parameter is set to zero. Note that the fan will only run at full speed if the drive is not in a UU condition.

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

When drive terminals are programmed to non default settings the result of incorrect or delayed programming must be considered. The use of warming a Smartcard in boot mode or an SM-Applications module can ensure drive parameters are immediately programmed to avoid this situation.

#### Figure 11-17 Open-loop brake function

Figure 11-18 Open-loop brake sequence

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

When drive terminals are programmed to non default settings the result of incorrect or delayed programming must be considered. The use of a Smartcard in boot mode or an SM-Applications module can ensure drive parameters are immediately programmed to avoid this situation.

\* The position controller is disabled and the error integrator is also reset under the following conditions:

- 1. If the drive is disabled (i.e. inhibited, ready or tripped)
- 2. If the position controller mode (Pr **13.10**) is changed. The position controller is disabled transiently to reset the error integrator.
- 3. The absolute mode parameter (Pr **13.11**) is changed. The position controller is disabled transiently to reset the error integrator.
- 4. One of the position sources is invalid.
- 5. The position feedback initialised parameter (Pr 3.48) is zero.

#### Solutions Module software

Most Solutions Modules contain software. The software version of the module can be checked by looking at Pr **x.02** and Pr **x.51**.

The software version takes the form of zz.yy.xx, where Pr **x.02** displays zz.yy and Pr **x.51** displays xx. I.e. for software version 01.01.00, Pr **x.02** would display 1.01 and Pr **x.51** would display 0

The SM-Resolver, SM-Encoder Plus, SM-Encoder Output Plus and SM-I/O Plus modules do not contain any software, so Pr **x.02** and Pr **x.51** either show 0 (software V01.07.01 and earlier) or the parameters do not appear (software V01.08.00 and later).

\* The menu 0 references are only valid when the second motor map parameters have been made active by setting Pr **11.45** to 1. (The second motor map only becomes effective when the output stage of the drive is not enabled, i.e. inh, rdY, or trip states.)

When the second motor map parameters are active, the symbol 'Mot2' will appear in the lower left hand corner of the LCD display or the decimal point that is second from the right on the first row of the LED display is lit.

#### 11.21 Advanced features

This section gives information on some of the advanced functions of the drive. For additional information see the Advanced User Guide.

| Reference modes        | Pr 1.14, Pr 1.15 and Pr 8.39          |
|------------------------|---------------------------------------|
| Braking modes          | Pr <b>2.04</b> and Pr <b>2.08</b>     |
| S ramps                | Pr <b>2.06</b> and Pr <b>2.07</b>     |
| Torque modes           | Pr 4.08 and Pr 4.11                   |
| Stop modes             | Pr 6.01, Pr 6.06, Pr 6.07 and Pr 6.08 |
| Main loss modes        | Pr 6.03, Pr 6.48, Pr 4.13 and Pr 4.14 |
| Start/stop logic modes | Pr 6.04 and Pr 6.40                   |
| Catch a spinning motor | Pr 6.09 and Pr 5.40                   |
| Position loop modes    | Pr <b>13.10</b>                       |
| Fast disable           | Pr <b>6.29</b>                        |

| ₹<br>₽ |     | <b>9</b><br>Bit |       | -        | auto-s  | elec | ctio | n disat | ble | US |  |

If Pr 8.39 is set to OFF (0), then the setting of Pr 1.14 automatically changes the operation of digital inputs T28 and T29 by configuring the destination parameters Pr 8.25 and Pr 8.26. To allow Pr 8.25 and Pr 8.26 to be changed manually by the user, the automatic set-up must be disabled by setting Pr 8.39 to 1.

If Pr 8.39 is 0 and Pr 1.14 is changed, then a drive reset is required before the function of terminal T28 or T29 will become active.

### Table 11-8 Active reference

### **Preset references**

Preset references 1 to 8 are contained in Pr 1.21 to Pr 1.28.

#### **Keypad reference**

If Keypad reference is selected the drive sequencer is controlled directly by the keypad keys and the keypad reference parameter (Pr **1.17**) is selected. The sequencing bits, Pr **6.30** to Pr **6.34**, and Pr **6.37** have no effect and jog is disabled.

### Precision reference

If Precision reference is selected the speed reference is given  $\mbox{Pr}\, 1.18$  and  $\mbox{Pr}\, 1.19.$ 

# 11.21.2 Braking Modes

|    | 2.0 | )4                               | Ramp | mode | select |   |  |        |    |  |

This parameter does not affect the acceleration ramp, as the ramp output always rises at the programmed acceleration rate subject to the current limits. It is possible in under some unusual circumstances in open-loop mode (i.e. highly inductive supply) for the motor to reach a low speed in standard ramp mode, but not completely stop. It is also possible if the drive attempts to stop the motor with an overhauling load in any mode that the motor will not stop when standard ramp mode or fast ramp mode is used. If the drive is in the deceleration state the rate of fall of the frequency or speed is monitored. If this does not fall for 10 seconds the drive forces the frequency or the speed reference to zero. This only applies when the drive is in the deceleration state and not when the reference is simply set to zero.

### 0: Fast ramp

Fast ramp is used where the deceleration follows the programmed deceleration rate subject to current limits.

### 1: Standard ramp

Standard ramp is used. During deceleration, if the voltage rises to the standard ramp level (Pr **2.08**) it causes a controller to operate, the output of which changes the demanded load current in the motor. As the controller regulates the link voltage, the motor deceleration increases as the speed approaches zero speed. When the motor deceleration rate reaches the programmed deceleration rate the controller ceases to operate and the drive continues to decelerate at the programmed rate. If the standard ramp voltage (Pr **2.08**) is set lower than the nominal DC Bus level the drive will not decelerate the motor, but it will coast to rest. The output of the ramp controller (when active) is a current demand that is fed to the frequency changing current controller (Open-loop modes) or the torque producing current controller (Closed-loop vector or Servo modes). The gain of these controllers can be modified with Pr **4.13** and Pr **4.14**.

### 2: Standard ramp with motor voltage boost

This mode is the same as normal standard ramp mode except that the motor voltage is boosted by 20%. This increases the losses in the motor giving faster deceleration.

|    | 2.0 | 8     | Stand         | ard rar | np volt | age | • |            |                                                   |                             |    |
|----|-----|-------|---------------|---------|---------|-----|---|------------|---------------------------------------------------|-----------------------------|----|

| €  | D   | C_VOL | 0 to<br>TAGE_ |         | 1AX V   | Ŷ   |   | 400V<br>57 | 00V driv<br>drive: E<br>L<br>25V driv<br>0V drive | EUR> 7<br>JSA> 7<br>re: 895 | 75 |

This voltage is used as the control level for standard ramp mode. If this parameter is set too low the machine will coast to rest, and if it is set too high and no braking resistor is used the drive may give an over-volt 'OV' trip. The minimum level should be greater than the voltage produced on the DC Bus by the highest supply voltage. Normally the DC Bus voltage will be approximately the rms supply line voltage  $x \sqrt{2}$ .

Care should be taken in the setting of this parameter. It is recommended that the setting should be at least 50V higher than the maximum expected level of the DC Bus voltage. If this is not done, the motor may fail to decelerate on a STOP command.

# 11.21.3 S ramps

|    | 2.0               | 6 | S ram | p enab | le |   |  |       |    |  |
|----|-------------------|---|-------|--------|----|---|--|-------|----|--|
| R۱ | W Bit             |   |       |        |    |   |  |       | US |  |
| €  | OFF (0) or On (1) |   |       |        |    | ⇔ |  | OFF ( | 0) |  |

Setting this parameter enables the S ramp function. S ramp is disabled during deceleration using standard ramp. When the motor is accelerated again after decelerating in standard ramp the acceleration ramp used by the S ramp function is reset to zero.

|    | 2.0 | )7  | S ram                        | р ассе | leratio | n liı | mit  |   |     |    |  |

| sv |     |     |                              |        |         |       | 0.03 | 0 |     |    |  |

This parameter defines the maximum rate of change of acceleration/ deceleration. The default values have been chosen such that for the default ramps and maximum speed, the curved parts of the S will be 25% of the original ramp if S ramp is enabled.

| 1 | Safety      | Product     | Mechanical   | Electrical   | Getting | Basic      | Running   | Optimization | SMARTCARD | Onboard | Advanced   | Technical | Diagnostics | UL Listing  |
|---|-------------|-------------|--------------|--------------|---------|------------|-----------|--------------|-----------|---------|------------|-----------|-------------|-------------|
|   | Information | Information | Installation | Installation | Started | parameters | the motor | optimization | operation | PLC     | parameters | Data      | Diagnoolioo | Information |

Since the ramp rate is defined in s/100Hz or s/1000rpm and the S ramp parameter is defined in s<sup>2</sup>/100Hz or s<sup>2</sup>/1000rpm, the time T for the 'curved' part of the S can be determined from:

T = S ramp rate of change / Ramp rate

Enabling S ramp increases the total ramp time by the period T since an additional T/2 is added to each end of the ramp in producing the S.

# 11.21.4 Torque modes

|                    | 4.0                 | 8  | Torqu | e refer | ence |  |  |      |    |  |
|--------------------|---------------------|----|-------|---------|------|--|--|------|----|--|

| $\hat{\mathbb{C}}$ | ±USER_CURRENT_MAX % |    |       |         |      |  |  | 0.00 |    |  |

Parameter for main torque reference. The normal update rate for the torque reference is 4ms. However if analog inputs 2 or 3 on the drive are used as the source of the reference, the drive is in closed-loop vector or servo mode and the analog inputs are in voltage mode with zero offset, the sample time is reduced to  $250\mu s$ .

|    | 4.1 | 1   | Torqu | e mode | e selec | tor |  |   |    |  |
|----|-----|-----|-------|--------|---------|-----|--|---|----|--|
| R١ | N   | Uni |       |        |         |     |  |   | US |  |
| OL | ☆   |     | 0 to  | o 1    |         | ⇔   |  | 0 |    |  |
| CL | Ŷ   |     | 0 to  | o 4    |         | ~   |  | U |    |  |

#### Open loop

If this parameter is 0 normal frequency control is used. If this parameter is set to 1 the current demand is connected to the current PI controller giving closed loop torque/current demand as shown below. The current error is passed through proportional and integral terms to give a frequency reference which is limited to the range: -SPEED\_FREQ\_MAX to +SPEED\_FREQ\_MAX.

#### **Closed loop vector and Servo**

When this parameter is set to 1, 2 or 3 the ramps are not active while the drive is in the run state. When the drive is taken out of the run state, but not disabled, the appropriate stopping mode is used. It is recommended that coast stopping or stopping without ramps are used. However, if ramp stop mode is used the ramp output is pre-loaded with the actual speed at the changeover point to avoid unwanted jumps in the speed reference.

#### 0: Speed control mode

The torque demand is equal to the speed loop output.

#### 1: Torque control

The torque demand is given by the sum of the torque reference and the torque offset, if enabled. The speed is not limited in any way, however, the drive will trip at the overspeed threshold if runaway occurs.

#### 2: Torque control with speed override

The output of the speed loop defines the torque demand, but is limited between 0 and the resultant torque reference (Pr **4.08** and Pr **4.09** (if enabled)). The effect is to produce an operating area as shown below if the final speed demand and the resultant torque reference are both positive. The speed controller will try and accelerate the machine to the final speed demand level with a torque demand defined by the resultant torque reference. However, the speed cannot exceed the reference because the required torque would be negative, and so it would be clamped to zero.

Depending on the sign of the final speed demand and the resultant torque the four areas of operation shown below are possible.

This mode of operation can be used where torque control is required, but the maximum speed must be limited by the drive.

#### 3: Coiler/uncoiler mode

Positive final speed demand:

A positive resultant torque will give torque control with a positive speed limit defined by the final speed demand. A negative resultant torque will give torque control with a negative speed limit of -5rpm.

Negative final speed demand:

A negative resultant torque will give torque control with a negative speed limit defined by the final speed demand. A positive resultant torque will give torque control with a positive speed limit of +5rpm.

#### Example of coiler operation:

This is an example of a coiler operating in the positive direction. The final speed demand is set to a positive value just above the coiler reference speed. If the resultant torque demand is positive the coiler operates with a limited speed, so that if the material breaks the speed does not exceed a level just above the reference. It is also possible to decelerate the coiler with a negative resultant torque demand. The coiler will decelerate down to -5rpm until a stop is applied. The operating area is shown in the following diagram.

| SafetyProductMechanicalElectricalGettingBasicRunningOptimizationSMARTCARDOnboardAdvancedTechnicaInformationInstallationInstallationStartedparametersthe motorOptimizationPLCparametersData | Diagnostics UL Listing Information | Technical<br>Data |  | DI C |  | Optimization | 5 |  | 5 |  |  |  |  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-------------------|--|------|--|--------------|---|--|---|--|--|--|--|
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-------------------|--|------|--|--------------|---|--|---|--|--|--|--|

#### Example of uncoiler operation:

This is an example for an uncoiler operating in the positive direction. The final speed demand should be set to a level just above the maximum normal speed. When the resultant torque demand is negative the uncoiler will apply tension and try and rotate at 5rpm in reverse, and so take up any slack. The uncoiler can operate at any positive speed applying tension. If it is necessary to accelerate the uncoiler a positive resultant torque demand is used. The speed will be limited to the final speed demand. The operating area is the same as that for the coiler and is shown below:

#### 4: Speed control with torque feed-forward

The drive operates under speed control, but a torque value may be added to the output of the speed controller. This can be used to improve the regulation of systems where the speed loop gains need to be low for stability.

| 5: Disable                                            | Inverter<br>disabled                                                                                  |                                                                                               | Allows the drive to be<br>immediately disabled and<br>then re-enabled again<br>immediately if required.                                                                                                                                                             |  |  |  |  |  |  |  |

Once modes 3 or 4 have begun the drive must go through the ready state before being restarted either by stopping, tripping or being disabled.

If this parameter is set to DiASbLE (5), the disable stopping mode is used when the run command is removed. This mode will allow the drive to be started immediately by re-applying the run command. However, if the drive is disabled by removing the drive enable (i.e. via the Enable SAFE TORQUE OFF (SECURE DISABLE) input or Pr **6.15** *Drive enable*) then the drive cannot be re-enabled for 1s.

#### **Closed loop vector and Servo**

Only one stopping phases exists and the ready state is entered as soon as the single stopping action is complete.

| Stopping Mode | Action                |  |  |  |
|---------------|-----------------------|--|--|--|
| 0: Coast      | Inhibits the inverter |  |  |  |
| 1: Ramp       | Stop with ramp        |  |  |  |
| 2: No ramp    | Stop with no ramp     |  |  |  |

The motor can be stopped with position orientation after stopping. This mode is selected with the position controller mode parameter (Pr **13.10**). When this mode is selected Pr **6.01** has no effect.

| 6.06 |   | Injection braking level |  |  |  |   |  |       |  |    |  |

### 0: diS

There is no line power supply loss detection and the drive operates normally only as long as the DC bus voltage remains within specification (i.e. >Vuu). Once the voltage falls below Vuu an under-voltage 'UV' trip occurs. This will reset itself if the voltage rises above Vuu Restart, as stated in the table below.

### 1: StoP - Open-loop

The action taken by the drive is the same as for ride through mode, except the ramp down rate is at least as fast as the deceleration ramp setting and the drive will continue to decelerate and stop even if the line power supply is re-applied. If normal or timed injection braking is selected the drive will use ramp mode to stop on loss of the supply. If ramp stop followed by injection braking is selected, the drive will ramp to a stop and then attempt to apply dc injection. At this point, unless the line power supply has been restored, the drive is likely to initiate a trip.

### 1: StoP - Closed-loop vector or Servo

The speed reference is set to zero and the ramps are disabled allowing the drive to decelerate the motor to a stop under current limit. If the Line power supply is re-applied while the motor is stopping any run signal is ignored until the motor has stopped. If the current limit value is set very low level the drive may trip UV before the motor has stopped.

### 2: ridE.th

The drive detects line power supply loss when the DC Bus voltage falls below  $Vml_1$ . The drive then enters a mode where a closed-loop controller attempts to hold the DC Bus level at  $Vml_1$ . This causes the motor to decelerate at a rate that increases as the speed falls. If the line power supply is re-applied it will force the DC Bus voltage above the detection threshold  $Vml_3$  and the drive will continue to operate normally. The output of the line power supply loss controller is a current demand that is fed into the current control system and therefore the gain Pr **4.13** and Pr **4.14** must be set up for optimum control. See parameters Pr **4.13** 

The following table shows the voltage levels used by drives with each voltage rating.

| Voltage level    | 200V drive             | 400V drive             | 575V drive             | 690V drive |  |  |  |
|------------------|------------------------|------------------------|------------------------|------------|--|--|--|
| Vuu              | 175                    | 330                    | 435                    |            |  |  |  |
| Vml <sub>1</sub> | 205*                   | 410*                   | 540*                   |            |  |  |  |
| Vml <sub>2</sub> | Vml <sub>1</sub> - 10V | Vml <sub>1</sub> - 20V | Vml <sub>1</sub> - 25V |            |  |  |  |
| Vml <sub>3</sub> | Vml <sub>1</sub> + 10V | Vml <sub>1</sub> + 15V | Vml <sub>1</sub> + 50V |            |  |  |  |
| Vuu Restart      | 215                    | 425                    | 59                     | 90         |  |  |  |

 $^{\ast}$  Vml\_1 is defined by Pr **6.48**. The values in the table above are the default values.

|    | 6.4 | 8     | Line p         | ower s | supply | loss ride through detection level |  |          |                                          |                  |  |

| €  | D   | C_VOL | 0 to<br>_TAGE_ |        | 1AX V  | 合                                 |  | 40<br>57 | 0V driv<br>0V driv<br>5V driv<br>0V driv | e: 410<br>e: 540 |  |

The line power supply loss detection level can be adjusted using this parameter. If the value is reduced below the default value, the default value is used by the drive. If the level is set too high, so that the line power supply loss detection becomes active under normal operating conditions, the motor will coast to a stop.

| 4.13 Current loop P gain |                    |     |             |  |  |   |  |                         |                                           |                  |  |  |  |

### **Open-loop**

These parameters control the proportional and integral gains of the current controller used in the open loop drive. As already mentioned the current controller either provides current limits or closed loop torque control by modifying the drive output frequency. The control loop is also used in its torque mode during line power supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate the flow of current into the drive. Although the default settings have been chosen to give suitable gains for less demanding applications it may be necessary for the user to adjust the performance of the controller. The following is a guide to setting the gains for different applications.

Current limit operation:

The current limits will normally operate with an integral term only, particularly below the point where field weakening begins. The proportional term is inherent in the loop. The integral term must be increased enough to counter the effect of the ramp which is still active even in current limit. For example, if the drive is operating at constant frequency and is overloaded the current limit system will try to reduce the output frequency to reduce the load. At the same time the ramp will try to increase the frequency back up to the demand level. If the integral gain is increased too far the first signs of instability will occur when operating around the point where field

and Pr 4.14 for set-up details.

| Safety      | Product     | Mechanical   | Electrical   | Getting | Basic      | Running   | Optimization | SMARTCARD | Onboard | Advanced   | Technical | Diagnostics | UL Listing  |
|-------------|-------------|--------------|--------------|---------|------------|-----------|--------------|-----------|---------|------------|-----------|-------------|-------------|
| Information | Information | Installation | Installation | Started | parameters | the motor | Optimization | operation | PLC     | parameters | Data      | Diagnostics | Information |

weakening begins. These oscillations can be reduced by increasing the proportional gain. A system has been included to prevent regulation because of the opposite actions of the ramps and the current limit. This can reduce the actual level that the current limit becomes active by 12.5%. This still allows the current to increase up to the current limit set by the user. However the current limit flag (Pr **10.09**) could become active up to 12.5% below the current limit depending on the ramp rate used.

### Torque control:

Again the controller will normally operate with an integral term only, particularly below the point where field weakening begins. The first signs of instability will appear around base speed, and can be reduced by increasing the proportional gain. The controller can be less stable in torque control mode rather than when it is used for current limiting. This is because load helps to stabilise the controller, and under torque control the drive may operate with light load. Under current limit the drive is often under heavy load unless the current limits are set at a low level.

### Line power supply loss and controlled standard ramp:

The DC bus voltage controller becomes active if line power supply loss detection is enabled and the drive supply is lost or controlled standard ramp is being used and the machine is regenerating. The DC bus controller attempts to hold the DC bus voltage at a fixed level by controlling the flow of current from the drive inverter into its DC bus capacitors. The output of the DC bus controller is a current demand which is fed into the current PI controller as shown in the following diagram.

Although it is not usually necessary the DC bus voltage controller can be adjusted with Pr **5.31**. However, it may often be necessary to adjust the current controller gains to obtain the required performance. If the gains are not suitable it is best to set up the drive in torque control first. Set the gains to a value that does not cause instability around the point at which field weakening occurs. Then revert back to open loop speed control in standard ramp mode. To test the controller the supply should be removed while the motor is running. It is likely that the gains can be increased further if required because the DC bus voltage controller has a stabilising effect, provided that the drive is not required to operate in torque control mode.

### **Closed-loop vector and Servo**

The Kp and Ki gains are used in the voltage based current controller. The default values give satisfactory operation with most motors. However it may be necessary to change the gains to improve the performance. The proportional gain (Pr **4.13**) is the most critical value in controlling the performance. Either the value can be set by auto-tuning (see Pr **5.12**) or it can be set by the user so that

Pr **4.13** = Kp = (L / T) x (
$$I_{fs}$$
 /  $V_{fs}$ ) x (256 / 5)

Where:

T is the sample time of the current controllers. The drive compensates for any change of sample time, and so it should be assumed that the sample time is equivalent to the lowest sample rate of  $167\mu s$ .

L is the motor inductance. For a servo motor this is half the phase to phase inductance that is normally specified by the manufacturer. For an induction motor this is the per phase transient inductance ( $\sigma L_s$ ). This is the inductance value stored in Pr **5.24** after the autotune test

is carried out. If  $\sigma L_s$  cannot be measured it can be calculated from the steady state per-phase equivalent circuit of the motor as follows:

$$\sigma \mathbf{L}_{\mathbf{s}} = \mathbf{L}_{\mathbf{s}} - \left(\frac{\mathbf{L}_{\mathbf{m}}^{2}}{\mathbf{L}_{\mathbf{r}}}\right)$$

 $I_{fs}$  is the peak full scale current feedback = K\_C x  $\sqrt{2}$  / 0.45. Where K\_C is defined in Table 11-5.

V<sub>fs</sub> is the maximum DC Bus voltage.

Pr **4.13** = Kp = (L / 167
$$\mu$$
s) x (K<sub>C</sub> x  $\sqrt{2}$  / 0.45 / V<sub>fs</sub>) x (256 / 5)  
= K x L x K<sub>C</sub>

Where:

 $K = [\sqrt{2} / (0.45 \text{ x V}_{fs} \text{ x 167}\mu\text{s})] \text{ x (256 / 5)}$ 

| Drive voltage rating | Vfs   | K    |
|----------------------|-------|------|
| 200V                 | 415V  | 2322 |
| 400V                 | 830V  | 1161 |
| 575V                 | 990V  | 973  |
| 690V                 | 1190V | 809  |

This set-up will give a step response with minimum overshoot after a step change of current reference. The approximate performance of the current controllers will be as given below. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth, however, this gives at step response with approximately 12.5% overshoot.

| Switching<br>frequency<br>kHz | Current control<br>sample time<br>µs | Gain<br>bandwidth<br>Hz | Phase<br>delay<br>μs |

| 12                            | 83                                   | TBA                     | 415                  |
| 16                            | 125                                  | TBA                     | 625                  |

The integral gain (Pr 4.14) is less critical and should be set so that

Pr 4.14 = Ki = Kp x 256 x T / 
$$\tau_m$$

Where:

 $\tau_m$  is the motor time constant (L / R).

R is the per phase stator resistance of the motor (i.e. half the resistance measured between two phases).

### Therefore

 $\label{eq:pressure} \begin{array}{l} \mbox{Pr} \mbox{ 4.14 } = \mbox{Ki} = (\mbox{K} \mbox{ x } \mbox{L} \mbox{ x } \mbox{K}_C) \mbox{ x } 256 \mbox{ x } 167 \mbox{\mu s } \mbox{ x } \mbox{R} \mbox{/ L} \\ = 0.0427 \mbox{ x } \mbox{K} \mbox{ x } \mbox{R} \mbox{ x } \mbox{K}_C \end{array}$ 

The above equation gives a conservative value of integral gain. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed closed-loop induction motor applications) the integral gain may need to have a significantly higher value.

# 11.21.7 Start / stop logic modes

| €  | 0 to 4 |     |         |        |         | ⇔    | 0 |    |  |

This parameter is provided to allow the user to select several predefined digital input routing macros to control the sequencer. When a value between 0 and 3 is selected the drive processor continuously updates the destination parameters for digital I/O T25, T26 and T27, and the enable sequencer latching bit (Pr **6.40**). When a value of 4 is selected the destination parameters for these digital I/O and Pr **6.40** can be modified by the user.

| 4       | programmable   | programmable   | programmable   | programmable   |

If Pr **6.04** has been set to a value of 0 to 3, then setting Pr **6.04** to 4 does not automatically reconfigure terminals T25, T26 and T27 to their default functions. To return terminals T25, T26 and T27 to their default functions, one of the following operations should be performed.

- Drive defaults should be restored. See section 5.8 *Restoring* parameter defaults on page 100 for details.
- Manually set Pr 6.04 to 4, Pr 6.40 to 0, Pr 8.22 to 10.33, Pr 8.23 to 6.30, and Pr 8.24 to 6.32.

| Figuro 11-49 | Digital input connections when Pr 6.04 is set to 0 to 3 |
|--------------|---------------------------------------------------------|

|-----------|-------------------|-----|--------|--------------------------|--|---|--|--|-------|----|--|
| R١        | N                 | Bit |        |                          |  |   |  |  |       | US |  |
| $\hat{U}$ | OFF (0) or On (1) |     |        |                          |  | ₽ |  |  | OFF ( | 0) |  |

This parameter enables sequencer latching. When sequencer latching is

used, a digital input must be used as a run permit or not stop input. The digital input should write to Pr **6.39**. The run permit or not stop input must be made active to allow the drive to run. Making the run permit or not stop input inactive resets the latch and stops the drive.

# 11.21.8 Catch a spinning motor

| 6.09 Catch a spinning m |   |     |      |     |  | oto | r |   |    |  |

### Open-loop

When the drive is enabled with this parameter at zero, the output frequency starts at zero and ramps to the required reference. When the drive is enabled with this parameter at a non-zero value, the drive performs a start-up test to determine the motor speed and then sets the initial output frequency to the synchronous frequency of the motor.

The test is not carried out and the motor frequency starts at zero if one of the following is true.

- The run command is given when the drive is in the stop state
- The drive is first enabled after power-up with Ur\_l voltage mode (Pr 5.14 = Ur\_l).
- The run command is given with Ur\_S voltage mode (Pr 5.14 = Ur\_S).

With default parameters the length of the test is approximately 250ms, however, if the motor has a long rotor time constant (usually large motors) it may be necessary to extend the test time. The drive will do this automatically if the motor parameters including the rated load rpm are set up correctly for the motor.

For the test to operate correctly it is important that the stator resistance (Pr **5.17** or Pr **21.12**) is set up correctly. This applies even if fixed boost (Pr **5.14** = Fd) or square law (Pr **5.14** = SrE) voltage mode is being used. The test uses the rated magnetising current of the motor during the test, therefore the rated current (Pr **5.07**, Pr **21.07** and Pr **5.10**, Pr **21.10**) and power factor should be set to values close to those of the motor, although these parameters are not as critical as the stator resistance. For larger motors it may be necessary to increase Pr **5.40** *Spin start boost* from its default value of 1.0 for the drive to successfully detect the motor speed.

It should be noted that a stationary lightly loaded motor with low inertia might move slightly during the test. The direction of the movement is undefined. Restrictions may be placed on the direction of this movement and on the frequencies detected by the drive as follows:

| Pr 6.09 | Function                         |
|---------|----------------------------------|
| 0       | Disabled                         |
| 1       | Detect all frequencies           |
| 2       | Detect positive frequencies only |
| 3       | Detect negative frequencies only |

### **Closed-loop vector and Servo**

When the drive is enabled with this bit at zero, the post ramp reference (Pr **2.01**) starts at zero and ramps to the required reference. When the drive is enabled with this bit at one, the post ramp reference is set to the motor speed.

When closed-loop vector mode is used without position feedback, and catch a spinning motor is not required, this parameter should be set to zero as this avoids unwanted movement of the motor shaft when zero speed is required. When closed-loop vector mode without position feedback is used with larger motors it may be necessary to increase Pr **5.40** *Spin start boost* from its default value of 1.0 for the drive to successfully detect the motor speed.

| Safety<br>InformationProduct<br>InstallationMechanical<br>InstallationElectrical<br>InstallationGetting<br>StartedBasic<br>parametersRunning<br>the motorOptimizationSMARTCARD<br>operationOnboard<br>parametersAdvanced<br>parametersTechnical<br>Data | UL Listing<br>Information |

### Non-rigid position control

| 5.4      | 10  | Spin start boost |        |  |   |  |     |    |  |
|----------|-----|------------------|--------|--|---|--|-----|----|--|
| RW       | Uni |                  |        |  |   |  |     | US |  |
| OL<br>VT |     | 0.0 to           | 0 10.0 |  | ₽ |  | 1.0 |    |  |

If Pr **6.09** is set to enable the catch a spinning motor function in openloop mode or closed-loop vector mode without position feedback, (Pr **3.24** = 1 or 3) this parameter defines a scaling function used by the algorithm that detects the speed of the motor. It is likely that for smaller motors the default value of 1.0 is suitable, but for larger motors this parameter may need to be increased. If the value of this parameter is too large the motor may accelerate from standstill when the drive is enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the motor is spinning.

# 11.21.9 Position modes

|    | 13. | 10  | Positi | on con | troller | mo | de |   |   |    |  |
|----|-----|-----|--------|--------|---------|----|----|---|---|----|--|
| R١ | N   | Uni |        |        |         |    |    |   |   | US |  |
| OL | ☆   |     | 0 t    | o 2    |         | ⇒  |    | 0 |   |    |  |
| CL | Ŷ   |     | 0 t    | 06     |         | ~  |    |   | Ū |    |  |

This parameter is used to set the position controller mode as shown in the table below.

| Parameter<br>value | Mode                                       | Feed forward<br>active |
|--------------------|--------------------------------------------|------------------------|
| 0                  | Position controller disabled               |                        |
| 1                  | Rigid position control                     | $\checkmark$           |
| 2                  | Rigid position control                     |                        |
| 3                  | Non-rigid position control                 | ✓                      |
| 4                  | Non-rigid position control                 |                        |
| 5                  | Orientation on stop                        |                        |
| 6                  | Orientation on stop and when drive enabled |                        |

### **Rigid position control**

In rigid position control the position error is always accumulated. This means that, if for example, the slave shaft is slowed down due to excessive load, the target position will eventually be recovered by running at a higher speed when the load is removed.

In non-rigid position control the position loop is only active when the 'At Speed' condition is met (see Pr **3.06**). This allows slippage to occur while the speed error is high.

### Velocity feed forward

The position controller can generate a velocity feed forwards value from the speed of the reference encoder. The feed-forwards value is passed to menu, and so ramps may be included if required. Because the position controller only has a proportional gain, it is necessary to use velocity feed-forwards to prevent a constant position error that would be proportional to the speed of the reference position.

If for any reason the user wishes to provide the velocity feed forward from a source other than the reference position, the feed forward system can be made inactive, i.e. Pr 13.10 = 2 or 4. The external feed forward can be provided via Menu 1 from any of the frequency/speed references. However, if the feed forward level is not correct a constant position error will exist.

### **Relative jogging**

If relative jogging is enabled the feedback position can be made to move relative the reference position at the speed defined by Pr **13.17**.

### Orientation

If Pr **13.10** is 5 the drive orientates the motor following a stop command. If hold zero speed is enabled (Pr **6.08** = 1) the drive remains in position control when orientation is complete and hold the orientation position. If hold zero speed is not enabled the drive is disabled when orientation is complete.

If Pr **13.10** is 6 the drive orientates the motor following a stop command and whenever the drive is enabled provided that hold zero speed is enabled (Pr **6.08** = 1). This ensures that the spindle is always in the same position following the drive being enabled.

When orientating from a stop command the drive goes through the following sequence:

- 1. The motor is decelerated or accelerated to the speed limit programmed in Pr **13.12**, using ramps if these are enabled, in the direction the motor was previously running.
- 2. When the ramp output reaches the speed set in Pr **13.12**, ramps are disabled and the motor continues to rotate until the position is found to be close to the target position (i.e. within 1/32 of a revolution). At this point the speed demand is set to 0 and the position loop is closed.
- 3. When the position is within the window defined by Pr 13.14, the orientation complete indication is given in Pr 13.15.

The stop mode selected by Pr 6.01 has no effect if orientation is enabled.

### 11.21.10 Fast Disable Software V01.10.00 and later

|   | 6.29              |  | Hardw | /are en | able |   |    |    |  |
|---|-------------------|--|-------|---------|------|---|----|----|--|
| R | RO Bit            |  |       |         |      |   | NC | PT |  |
| € | OFF (0) or On (1) |  |       |         |      | ₽ |    |    |  |

This bit is a duplicate of Pr **8.09** and reflects the state of the enable input. With software V01.10.00 and later, if the destination of one of the drive digital I/O (Pr **8.21** to Pr **8.26**) is set to Pr **6.29** and the I/O is set as an input, the state of the input does not affect the value of this parameter as it is protected, however, it does provide a fast disable function.

The SAFE TORQUE OFF (SECURE DISABLE) input to the drive (T31) disables the drive in hardware by removing the gate drive signals from the inverter IGBT's and also disables the drive via the software system. When the drive is disabled by de-activating the SAFE TORQUE OFF (SECURE DISABLE) input (T31) there can be a delay of up to 20ms (typically 8ms) before the drive is disabled. However, if a digital I/O is set up to provide the fast disable function it is possible to disable the drive within 600µs of de-activating the input. To do this an enable signal should be given to both the SAFE TORQUE OFF (SECURE DISABLE) input (T31) and to the digital I/O selected for the fast disable function. The state of the digital I/O including the effect of its associated invert parameter is ANDed with the SAFE TORQUE OFF (SECURE DISABLE) (T31) to enable the drive

If the safety function of the SAFE TORQUE OFF (SECURE DISABLE) input is required then there must not be a direct connection between the SAFE TORQUE OFF (SECURE DISABLE) input (T31) and any other digital I/O on the drive. If the safety function of the SAFE TORQUE OFF (SECURE DISABLE) input and the fast disable function is required then the drive should be given two separate independent enable signals. A safety related enable from a safe source connected to the SAFE TORQUE OFF (SECURE DISABLE) input on the drive. A second enable connected to the digital I/O on the drive selected for the fast disable function. The circuit must be arranged so that a fault which causes the fast input to be forced high cannot cause the SAFE TORQUE OFF (SECURE DISABLE) input to be forced high, including the case where a component such as a blocking diode has failed.

### NOTE

For the definition of ambient temperature, see section 3.7 Enclosure design and drive ambient temperature on page 43.

### Size 0 and SP2404 power and current ratings

All drive models are dual rated except for size 0 and model SP2404 which only have a Heavy Duty rating. However, if the current limits in **4.05** to Pr **4.07** are set to a maximum of 110% and the switching frequency is greater than 3kHz, then the drive can be used at a maximum continuous current higher than the Heavy Duty rating. See the Normal Duty ratings in Table 12-1, Table 12-2 and Table 12-3. Normal Duty ratings exist for the size 0 and SP2404 above 3kHz when the overload is reduced from the default value 165% in open loop or 175% in closed loop, to 110%.

If the current limits in Pr 4.05 to Pr 4.07 are set higher than 110% then the Heavy Duty current ratings are applicable.

### Table 12-7 Power losses from the front of the drive when throughpanel mounted

| Frame size | Power loss |
|------------|------------|
| 1          | ≤50W       |
| 2          | ≤75W       |
| 3          | ≤100W      |
| 4          | ≤204W      |
| 5          | ≤347W      |
| 6          | ≤480W      |

### 12.1.3 Supply requirements

Voltage:

| SPX2XX | 200V to 240V ±10% |
|--------|-------------------|
| SPX4XX | 380V to 480V ±10% |
| SPX5XX | 500V to 575V ±10% |
| SPX6XX | 500V to 690V ±10% |
|        |                   |

Number of phases: 3\*

\* 200V size 0 drives can also be used on a single phase supply.

Maximum supply imbalance: 2% negative phase sequence (equivalent to 3% voltage imbalance between phases).

Frequency range: 48 to 65 Hz

For UL compliance only, the maximum supply symmetrical fault current must be limited to  $100 \mbox{kA}$ 

### Size 6 heatsink fan supply requirements

| Nominal voltage:          | 24V                                                          |
|---------------------------|--------------------------------------------------------------|
| Minimum voltage:          | 23.5V                                                        |
| Maximum voltage:          | 27V                                                          |
| Current drawn:            | 3.3A                                                         |
| Recommended power supply: | 24V, 100W, 4.5A                                              |
| Recommended fuse:         | 4A fast blow (I <sup>2</sup> t less than 20A <sup>2</sup> s) |

# 12.1.4 Line reactors

Input line reactors reduce the risk of damage to the drive resulting from poor phase balance or severe disturbances on the supply network.

Where line reactors are to be used, reactance values of approximately 2% are recommended. Higher values may be used if necessary, but may result in a loss of drive output (reduced torque at high speed) because of the voltage drop.

For all drive ratings, 2% line reactors permit drives to be used with a supply unbalance of up to 3.5% negative phase sequence (equivalent to 5% voltage imbalance between phases).

Severe disturbances may be caused by the following factors, for example:

- Power factor correction equipment connected close to the drive.
  Large DC drives having no or inadequate line reactors connected to
- Large DC drives having no or inadequate line reactors connected to the supply.
- Across the line (DOL) started motor(s) connected to the supply such that when any of these motors are started, the voltage dip exceeds 20%

Such disturbances may cause excessive peak currents to flow in the input power circuit of the drive. This may cause nuisance tripping, or in extreme cases, failure of the drive.

Drives of low power rating may also be susceptible to disturbance when connected to supplies with a high rated capacity.

Line reactors are particularly recommended for use with the following drive models when one of the above factors exists, or when the supply capacity exceeds 175kVA:

 SP0201
 SP0202
 SP0203
 SP0204
 SP0205

 SP0401
 SP0402
 SP0403
 SP0404
 SP0405

 SP1201
 SP1202
 SP1203
 SP1204
 SP1204

 SP1401
 SP1402
 SP1403
 SP1404

Model sizes SP1405 to SP4606 have an internal DC choke and SP5201 to SP6602 have internal AC line chokes, so they do not require AC line reactors except for cases of excessive phase unbalance or extreme

supply conditions.

When required each drive must have its own reactor(s). Three individual reactors or a single three-phase reactor should be used.

# **Reactor current ratings**

The current rating of the line reactors should be as follows:

Continuous current rating:

Not less than the continuous input current rating of the drive

Repetitive peak current rating:

Not less than twice the continuous input current rating of the drive

# 12.1.5 Motor requirements

No. of phases: 3

Maximum voltage: Unidrive SP (200V): 240V Unidrive SP (400V): 480V Unidrive SP (575V): 575V Unidrive SP (690V): 690V

# 12.1.6 Temperature, humidity and cooling method

Ambient temperature operating range:

0°C to 50°C (32°F to 122°F).

Output current derating must be applied at ambient temperatures >40°C (104°F).

Minimum temperature at power-up:

-15°C (5°F), the supply must be cycled when the drive has warmed up to 0°C (32°F).

Cooling method: Forced convection

Maximum humidity: 95% non-condensing at 40°C (104°F)

### 12.1.7 Storage

-40°C (-40°F) to +50°C (122°F) for long term storage, or to +70°C (158°F) for short term storage.

### 12.1.8 Altitude

Altitude range: 0 to 3,000m (9,900 ft), subject to the following conditions:

1,000m to 3,000m (3,300 ft to 9,900 ft) above sea level: de-rate the maximum output current from the specified figure by 1% per 100m (330 ft) above 1,000m (3,300 ft)

For example at 3,000m (9,900ft) the output current of the drive would have to be de-rated by 20%.

# 12.1.9 IP / UL Rating

The Unidrive SP is rated to IP20 pollution degree 2 (dry, non-conductive contamination only) (NEMA 1). However, it is possible to configure the drive to achieve IP54 rating (NEMA 12) at the rear of the heatsink for through-panel mounting (some current derating is required).

In order to achieve the high IP rating at the rear of the heatsink with Unidrive SP size 1 and 2, it is necessary to seal a heatsink vent by fitting the IP54 insert as shown in Figure 3-34 and Figure 3-35 on page 45. For increased fan life time in a dirty environment the heatsink fan must be replaced with an IP54 rated fan on size 1 to 4. Sizes 5 and 6 are installed with IP54 heatsink fans as standard. Contact the supplier of the drive for details. Fitting of the IP54 insert and/or IP54 rated fan on sizes 1 and 2 requires output current derating to be applied, see section 12.1.1 *Power and current ratings (Derating for switching frequency and temperature)* on page 258 for further details.

The IP rating of a product is a measure of protection against ingress and contact to foreign bodies and water. It is stated as IP XX, where the two digits (XX) indicate the degree of protection provided as shown in Table 12-8.

| Safety     | Product       | Mechanical   | Electrical   | Getting | Basic      | Running   | Ontimization | SMARTCARD | Onboard | Advanced   | Technical | Diagnostics | UL Listing  |

### Table 12-9 UL enclosure ratings

| UL rating | Description                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Туре 1    | Enclosures are intended for indoor use, primarily<br>to provide a degree of protection against limited<br>amounts of falling dirt.                       |
| Type 12   | Enclosures are intended for indoor use, primarily<br>to provide a degree of protection against dust,<br>falling dirt and dripping non-corrosive liquids. |

### 12.1.10 Corrosive gasses

Concentrations of corrosive gases must not exceed the levels given in:

- Table A2 of EN 50178
- Class 3C2 of IEC 60721-3-3

This corresponds to the levels typical of urban areas with industrial activities and/or heavy traffic, but not in the immediate neighbourhood of industrial sources with chemical emissions.

### 12.1.11 RoHS compliance

Unidrive SP size 0 meets EU directive 2002-95-EC for RoHS compliance.

### 12.1.12 Vibration

Maximum recommended continuous vibration level 0.14 g r.m.s. broadband 5 to 200 Hz.

### NOTE

This is the limit for broad-band (random) vibration. Narrow-band vibration at this level which coincides with a structural resonance could result in premature failure.

### **Bump Test**

Testing in each of three mutually perpendicular axes in turn. Referenced standard:IEC 60068-2-29: Test Eb: Severity: 18g (size 1 to 3), 6ms, half sine 10g (size 4 to 6), 6ms, half sine No. of Bumps: 600 (100 in each direction of each axis)

### **Random Vibration Test**

Testing in each of three mutually perpendicular axes in turn. Referenced standard:IEC 60068-2-64: Test Fh: Severity: 1.0 m<sup>2</sup>/s<sup>3</sup> (0.01 g<sup>2</sup>/Hz) ASD from 5 to 20 Hz -3 dB/octave from 20 to 200 Hz Duration: 30 minutes in each of 3 mutually perpendicular axes. Sinusoidal Vibration Test

Testing in each of three mutually perpendicular axes in turn. Referenced standard: IEC 60068-2-6: Test Fc: Frequency range: 5 to 500 Hz Severity: 3.5 mm peak displacement from 5 to 9 Hz 10 m/s<sup>2</sup> peak acceleration from 9 to 200 Hz 15 m/s<sup>2</sup> peak acceleration from 200 to 500 Hz Sweep rate: 1 octave/minute Duration: 15 minutes in each of 3 mutually perpendicular axes.

### 12.1.13 Starts per hour

By electronic control: unlimited

By interrupting the AC supply:  $\leq 20$  (equally spaced)

### 12.1.14 Start up time

This is the time taken from the moment of applying power to the drive, to the drive being ready to run the motor:

Sizes 0 to 6: 4s

### 12.1.15 Output frequency / speed range

Open-loop frequency range: 0 to 3,000Hz

Closed-loop speed range: 0 to 40,000rpm

Closed-loop frequency range: 0 to 1,250Hz\*

\*(Limit to ~600Hz for good performance)

# 12.1.16 Accuracy and resolution

### Speed: The absolute frequency and speed accuracy depends on the accuracy

of the crystal used with the drive microprocessor. The accuracy of the crystal is 100ppm, and so the absolute frequency/speed accuracy is 100ppm (0.01%) of the reference, when a preset speed is used. If an analog input is used the absolute accuracy is further limited by the absolute accuracy of the analog input.

The following data applies to the drive only; it does not include the performance of the source of the control signals.

Open loop resolution:

Preset frequency reference: 0.1Hz Precision frequency reference: 0.001Hz

Closed loop resolution

Preset speed reference: 0.1rpm Precision speed reference: 0.001rpm Analog input 1: 16bit plus sign Analog input 2: 10bit plus sign

### Current:

The resolution of the current feedback is 10bit plus sign. The typical accuracy of the current feedback is 2%.

### 12.1.17 Acoustic noise

The heatsink fan generates the majority of the acoustic noise produced by the drive. The heatsink fan on size 0 to 2 is a dual speed fan and on size 3 to 6 it is a variable speed fan. The drive controls the speed at which the fan runs based on the temperature of the heatsink and the drive's thermal model system. On size 4 to 6 the minimum speed of the heatsink fan is 0 rpm. The size 3 to 6 is also installed with a variable speed fan to ventilate the capacitor bank.

Table 12-10 gives the acoustic noise produced by the drive for the heatsink fan running at the maximum and minimum speeds.

### 12.1.20 Input current, fuse and cable size ratings

The input current is affected by the supply voltage and impedance.

### **Typical input current**

The values of typical input current are given to aid calculations for power flow and power loss.

The values of typical input current are stated for a balanced supply.

### Maximum continuous input current

The values of maximum continuous input current are given to aid the selection of cables and fuses. These values are stated for the worst case condition with the unusual combination of stiff supply with bad balance.

The value stated for the maximum continuous input current would only be seen in one of the input phases. The current in the other two phases would be significantly lower.

The values of maximum input current are stated for a supply with a 2% negative phase-sequence imbalance and rated at the maximum supply fault current given in Table 12-13.

### Table 12-13 Supply fault current used to calculate maximum input currents

| Model | Symmetrical fault level (kA) |
|-------|------------------------------|
| All   | 100                          |

\*The value in the bracket is when the drive is used on a 1 phase supply. \*\*Fast acting or high speed class J fuses only.

### NOTE

Cable sizes are from IEC60364-5-52:2001 table A.52.C with correction factor for 40°C ambient of 0.87 (from table A52.14) for cable installation method B2 (multicore cable in conduit).

Cable size may be reduced if a different installation method is used, or if the ambient temperature is lower.

The recommended cable sizes above are only a guide. The mounting and grouping of cables affects their current-carrying capacity, in some cases smaller cables may be acceptable but in other cases a larger cable is required to avoid excessive temperature or voltage drop. Refer to local wiring regulations for the correct size of cables.

| SP6602 | 144                  | 156     | 200     | 200      | 200                                     | 200        | 2 x 50                   | 2 x 50                    | 2 x 1         | 2 x 1           |                                 |                                   |                                    |     |      |     |      |

### NOTE

Cable sizes are from IEC60364-5-52:2001 table A.52.C with correction factor for 40°C ambient of 0.87 (from table A52.14) for cable installation method B2 (multicore cable in conduit).

Cable size may be reduced if a different installation method is used, or if the ambient temperature is lower.

The recommended cable sizes above are only a guide. The mounting and grouping of cables affects their current-carrying capacity, in some cases smaller cables may be acceptable but in other cases a larger cable is required to avoid excessive temperature or voltage drop. Refer to local wiring regulations for the correct size of cables.

### Inrush current

The drive will have an inrush current during power-up, the peak inrush is limited to the value shown below:

| SP020X | 18 A peak |
|--------|-----------|
| SP040X | 35 A peak |
| SP120X | 18 A peak |
| SP140X | 35 A peak |
| SP220X | 12 A peak |
| SP240X | 24 A peak |
| SP320X | 8 A peak  |
| SP340X | 14 A peak |
| SP350X | 18 A peak |
|        |           |

For sizes 4 to 6, the inrush current is limited by a controlled rectifier to below the rated current of the drive.

### NOTE

The inrush current for all drives after a brown-out can be larger than the power-up inrush.

### 12.1.21 Maximum motor cable lengths

Table 12-16 Maximum motor cable lengths (200V drives)

| 200V Nominal AC supply voltage |         |                                                                                 |                 |                |                |                |  |  |  |  |  |
|--------------------------------|---------|---------------------------------------------------------------------------------|-----------------|----------------|----------------|----------------|--|--|--|--|--|

| SP5602                         |                                                                              |         |         |         |       |       |  |  |  |
| SP6601                         |                                                                              |         |         |         |       |       |  |  |  |
| SP6602                         | 1                                                                            |         |         |         |       |       |  |  |  |

 Cable lengths in excess of the specified values may be used only when special techniques are adopted; refer to the supplier of the drive.

 The default switching frequency is 3kHz for Open-loop and Closedloop vector, and 6kHz for Servo.

The maximum cable length is reduced from that shown in Table 12-16 and Table 12-17 if high capacitance motor cables are used. For further information, refer to section *High-capacitance cables* on page 71.

### 12.1.22 Braking resistor values

 
 Table 12-20
 Minimum resistance values and peak power rating for the braking resistor at 40°C (104°F)

| Model            | Minimum<br>resistance*<br>Ω | Instantaneous<br>power rating<br>kW |
|------------------|-----------------------------|-------------------------------------|
| SP0201 to SP0205 | 35                          | 4.35                                |

<sup>1</sup> See section Surge immunity of control circuits - long cables and connections outside a building on page 83 for control ports for possible requirements regarding grounding and external surge protection

### Emission

The drive contains an in-built filter for basic emission control. An additional optional external filter provides further reduction of emission. The requirements of the following standards are met, depending on the motor cable length and switching frequency.

# Table 12-25 Size 0 (200V) emission compliance (single and three phase drives)

| Motor cable       | Switching frequency (kHz) |         |     |     |     |     |  |  |  |  |  |
|-------------------|---------------------------|---------|-----|-----|-----|-----|--|--|--|--|--|
| length (m)        | 3                         | 12      | 16  |     |     |     |  |  |  |  |  |
| Using internal fi | Using internal filter:    |         |     |     |     |     |  |  |  |  |  |

Key (shown in decreasing order of permitted emission level):

- E2R EN 61800-3 second environment, restricted distribution (Additional measures may be required to prevent interference)
- E2U EN 61800-3 second environment, unrestricted distribution
- T Industrial generic standard EN 50081-2 (EN 61000-6-4) EN 61800-3 first environment restricted distribution (The following caution is required by EN 61800-3)

This is a product of the restricted distribution class according to IEC 61800-3. In a residential environment this product may cause radio interference in which case the user may be CAUTION required to take adequate measures.

R Residential generic standard EN 50081-1 (EN 61000-6-3) EN 61800-3 first environment unrestricted distribution

EN 61800-3 defines the following:

- The first environment is one that includes residential premises. It also includes establishments directly connected without intermediate transformers to a low-voltage power supply network which supplies buildings used for residential purposes.
- The second environment is one that includes all establishments • other than those directly connected to a low-voltage power supply network which supplies buildings used for residential purposes.
- Restricted distribution is defined as a mode of sales distribution in which the manufacturer restricts the supply of equipment to suppliers, customers or users who separately or jointly have technical competence in the EMC requirements of the application of drives

### IEC 61800-3:2004 and EN 61800-3:2004

The 2004 revision of the standard uses different terminology to align the requirements of the standard better with the EC EMC Directive.

Power drive systems are categorised C1 to C4:

| Category | Definition                                                                                                                                                  | Corresponding<br>code used<br>above |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| C1       | Intended for use in the first or second environments                                                                                                        | R                                   |
| C2       | Not a plug-in or movable device, and<br>intended for use in the first environment<br>only when installed by a professional, or<br>in the second environment | I                                   |
| C3       | Intended for use in the second<br>environment, not the first environment                                                                                    | E2U                                 |
| C4       | Rated at over 1000V or over 400A,<br>intended for use in complex systems in<br>the second environment                                                       | E2R                                 |

Note that category 4 is more restrictive than E2R, since the rated current of the PDS must exceed 400A or the supply voltage exceed 1000V, for the complete PDS.

### 12.2 **Optional external EMC filters**

Table 12-36 EMC filter cross reference

| Drive                      | Type1     | Type2     |

### NOTE

1. 1M $\Omega$  in a  $\lambda$  connection between phases, with the  $\lambda$  point connected by a 680k $\Omega$  resistor to ground (i.e. line to line 2M $\Omega$ , line to ground 1.68M $\Omega$ )

2.  $1M\Omega$  in a  $\lambda$  connection between phases, with the  $\lambda$  point connected by a  $1.5M\Omega$  resistor to ground (i.e. line to line  $2M\Omega$ , line to ground  $2.5M\Omega$ ) 3.  $2M\Omega$  between phases with each phase connected by a  $660k\Omega$  resistance to ground.

4. 1.5M $\Omega$  in a  $\lambda$  connection between phases, with the  $\lambda$  point connected by a 680k $\Omega$  resistor to ground (i.e. line to line 3M $\Omega$ , line to ground 2.18M $\Omega$ )

5.  $1.8M\Omega$  in a  $\downarrow$  connection between phases, with the  $\downarrow$  point connected by a  $1.5M\Omega$  resistor to ground (i.e. line to line  $3.6M\Omega$ , line to ground  $3.3M\Omega$ )

6.  $470k\Omega$  between phases with each phase connected by a  $2M\Omega$  resistance to ground.

# 13 Diagnostics

The display on the drive gives various information about the status of the drive. These fall into three categories:

- Trip indications
- Alarm indications
- Status indications

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter. If a drive is faulty, it must be returned to an authorized

WARNING EPA distributor for repair.

# 13.1 Trip indications

If the drive trips, the output of the drive is disabled so that the drive stops controlling the motor. The upper display indicates that a trip has occurred and the lower display shows the trip. If this is a multi-module drive and a power module has indicated a trip, then the lower display will alternate between the trip string and the module number.

Trips are listed alphabetically in Table 13-1 based on the trip indication shown on the drive display. Refer to Figure 13-1.

If a display is not used, the drive LED Status indicator will flash if the drive has tripped. Refer to Figure 13-2.

The trip indication can be read in Pr **10.20** providing a trip number. Trip numbers are listed in numerical order in Table 13-2 so the trip indication can be cross referenced and then diagnosed using Table 13-1.

### Example

- 1. Trip code 3 is read from Pr 10.20 via serial communications.
- 2. Checking Table 13-2 shows Trip 3 is an OI.AC trip.

- 3. Look up OI.AC in Table 13-1.
- 4. Perform checks detailed under Diagnosis.

The trips can be grouped into the following categories. It should be noted that a trip can only occur when the drive is not tripped or is already tripped but with a trip with a lower priority number.

### Table 13-3 Trip categories

| Priority | Category                                  | Trips                                                                                                      | Comments                                                                                                                                                                                                                         |
|----------|-------------------------------------------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1        | Hardware faults                           | HF01 to HF16                                                                                               | These indicate serious internal problems and cannot be reset. The drive is inactive after one of these trips and the display shows <b>HFxx</b> . The Drive OK relay opens and the serial comms will not function.                |
| 2        | Non-resetable trips                       | HF17 to HF32, SL1.HF,<br>SL2.HF, SL3.HF                                                                    | Cannot be reset. Requires the drive to be powered down.                                                                                                                                                                          |
| 3        | EEF trip                                  | EEF                                                                                                        | Cannot be reset unless a code to load defaults is first entered in Pr xx.00 or Pr 11.43.                                                                                                                                         |
| 4        | SMARTCARD trips                           | C.boot, C.Busy, C.Chg,<br>C.OPtn, C.RdO, C.Err,<br>C.dat, C.FULL, C.Acc,<br>C.rtg, C.TyP, C.cpr,<br>C.Prod | Can be reset after 1.0s<br>SMARTCARD trips have priority 5 during power-up                                                                                                                                                       |
| 4        | Encoder power supply<br>trips             | PS.24V, EnC1                                                                                               | Can be reset after 1.0s<br>These trips can only override the following priority 5 trips: EnC2 to EnC8 or Enc11 to<br>Enc17                                                                                                       |
| 5        | Autotune                                  | tunE, tunE1 to tunE7                                                                                       | Can be reset after 1.0s, but the drive cannot be made to run unless it is disabled via the SAFE TORQUE OFF (SECURE DISABLE) input (terminal 31), <i>Drive enable</i> (Pr 6.15) or the <i>Control word</i> (Pr 6.42 and Pr 6.43). |
| 5        | Normal trips with<br>extended reset       | OI.AC, OI.Br, OIAC.P,<br>OIBr.P, OIdC.P                                                                    | Can be reset after 10.0s                                                                                                                                                                                                         |
| 5        | Normal trips                              | All other trips not<br>included in this table                                                              | Can be reset after 1.0s                                                                                                                                                                                                          |
| 5        | Non-important trips                       | th, thS, Old1, cL2, cL3,<br>SCL                                                                            | If Pr <b>10.37</b> is 1 or 3 (i.e. bit 0 set to 1), the drive will stop before tripping                                                                                                                                          |
| 5        | Phase loss                                | PH                                                                                                         | The drive attempts to stop before tripping                                                                                                                                                                                       |
| 5        | Drive over-heat based<br>on thermal model | O.ht3                                                                                                      | The drive attempts to stop before tripping, but if it does not stop within 10s the drive will automatically trip                                                                                                                 |
| 6        | Self-resetting trips                      | UV                                                                                                         | Under voltage trip cannot be reset by the user, but is automatically reset by the drive when the supply voltage is with specification                                                                                            |

Although the UV trip operates in a similar way to all other trips, all drive functions can still operate but the drive cannot be enabled. The following differences apply to the UV trip:

- Power-down save user parameters are saved when UV trip is activated except when the main high voltage supply is not active (i.e. operating in Low Voltage DC Supply Mode, Pr 6.44 = 1).
- 2. The UV trip is self-resetting when the DC bus voltage rises above the drive restart voltage level. If another trip is active instead of UV at this point, the trip is not reset.
- 3. The drive can change between using the main high voltage supply and low voltage DC supply only when the drive is in the under voltage condition (Pr 10.16 = 1). The UV trip can only be seen as active if another trip is not active in the under voltage condition.
- 4. When the drive is first powered up a UV trip is initiated if the supply voltage is below the restart voltage level and another trip is not active. This does not cause save power down save parameters to be saved at this point.

## 13.2 Alarm indications

In any mode an alarm flashes alternately with the data displayed on the 2nd row when one of the following conditions occur. If action is not taken to eliminate any alarm except "Autotune", "Lt" and "PLC" the drive may eventually trip. Alarms flash once every 640ms except "PLC" which flashes once every 10s. Alarms are not displayed when a parameter is being edited.

### Table 13-4 Alarm indications

| Lower<br>display                  | Description                                                                                                                       |

## 13.4 Displaying the trip history

The drive retains a log of the last 10 trips that have occurred in Pr **10.20** to Pr **10.29** and the corresponding multi-module drive module number (Pr **6.49** = 0) or the trip time (Pr **6.49** = 1) for each trip in Pr **10.41** to Pr **10.51**. The time of the trip is recorded from the powered-up clock (if Pr **6.28** = 0) or from the run time clock (if Pr **6.28** = 1).

Pr **10.20** is the most recent trip, or the current trip if the drive is in a trip condition (with the module number or trip time stored in Pr **10.41** and Pr **10.42**). Pr **10.29** is the oldest trip (with the module number or trip time stored in Pr **10.51**). Each time a new trip occurs, all the parameters move down one, such that the current trip (and time) is stored in Pr **10.20** (and Pr **10.41** to Pr **10.42**) and the oldest trip (and time) is lost out of the bottom of the log.

If any parameter between Pr **10.20** and Pr **10.29** inclusive is read by serial communications, then the trip number in Table 13-1 *Trip indications* on page 277 is the value transmitted.

## 13.5 Behaviour of the drive when tripped

If the drive trips, the output of the drive is disabled so that the drive stops controlling the motor. If any trip occurs (except the UV trip) the following read only parameters are frozen until the trip is cleared. This is to help in diagnosing the cause of the trip.

| Parameter | Description                              |
|-----------|------------------------------------------|
| 1.01      | Frequency/speed reference                |
| 1.02      | Pre-skip filter reference                |
| 1.03      | Pre-ramp reference                       |
| 2.01      | Post-ramp reference                      |
| 3.01      | Frequency slaving demand/Final speed ref |
| 3.02      | Speed feedback                           |
| 3.03      | Speed error                              |
| 3.04      | Speed controller output                  |
| 4.01      | Current magnitude                        |
| 4.02      | Active current                           |
| 4.17      | Reactive current                         |
| 5.01      | Output frequency                         |
| 5.02      | Output voltage                           |
| 5.03      | Power                                    |
| 5.05      | DC bus voltage                           |
| 7.01      | Analog input 1                           |
| 7.02      | Analog input 2                           |
| 7.03      | Analog input 3                           |

### Analog and digital I/O

The analog and digital I/O on the drive continue to work correctly if a trip occurs, except the digital outputs will go low if one of the following trips occur: O.Ld1, PS.24V.

### **Drive logic functions**

The drive logic functions (i.e. PID, variable selectors, threshold detectors, etc.) continue to operate when the drive is tripped.

### **Onboard PLC program**

The Onboard PLC program continues to run if the drive is tripped, except if one of Onboard PLC program trips occur.

### **Braking IGBT**

The braking IGBT continues to operate even when the output of the drive is not enabled (except if the low voltage DC supply is being used), but is only disabled if any of the following trips occurs or would occur if another trip had not already become active: OI.Br, PS, It.Br, OV or any HFxx trip.

# 14 UL Listing Information

Size 0 drives have been assessed to meet UL requirements.

Size 1 to 6 drives have been assessed to meet both UL and cUL requirements.

## 14.1 Common UL information

### Conformity

The drive conforms to UL listing requirements only when the following are observed:

- The drive is installed in a type 1 enclosure, or better, as defined by UL50
- The ambient temperature does not exceed 40°C (104°F) when the drive is operating
- The terminal tightening torques specified in section 3.12.2 Terminal sizes and torque settings on page 59
- If the drive control stage is supplied by an external power supply (+24V), the external power supply must be a UL Class 2 power supply

### Motor overload protection

The drive provides motor overload protection. The default overload protection level is no higher than 150% of full-load current (FLC) of the drive in open loop mode and no higher than 175% of full-load current (FLC) of the drive in closed loop vector or servo modes. It is necessary for the motor rated current to be entered into Pr **0.46** (or Pr **5.07**) for the protection to operate correctly. The protection level may be adjusted below 150% if required. Refer to section 8.3 *Current limits* on page 140 for more information. The drive also provides motor thermal protection. Refer to section 8.4 *Motor thermal protection* on page 140.

### **Overspeed Protection**

The drive provides overspeed protection. However, it does not provide the level of protection afforded by an independent high integrity overspeed protection device.

## 14.2 Power dependant UL information

### Conformity

The drive conforms to to UL listing requirements only when the following is observed.

### Fuses

### Size 0 to 3

 The correct UL-listed fast acting fuses (class CC or class J up to 30A and class J above 30A), e.g. Bussman Limitron KTK-R series, Ferraz Shawmut ATMR series or equivalent, are used in the AC supply. The drive does not comply with UL if MCBs are used in place of fuses.

For further details on fusing, refer to in Table 4-3 and Table 4-4 on page 68.

### Size 4 to 6

 The UL-listed Ferraz HSJ (High speed J class) fuses are used in the AC supply. The drive does not comply with UL if any other fuses or MCBs are used in place of those stated.

For further details on fusing, refer to Table 4-5 on page 69.

### **Field wiring**

### Size 0 to 4

 Class 1 60/75°C (140/167°F) copper wire only is used in the installation

### Size 5 and 6

Class 1 75°C (167°F) copper wire only is used in the installation

### **Field wiring connectors**

### Sizes 4 to 6

• UL listed wire connectors are used for terminating power circuit field wiring, e.g. Ilsco TA series

## 14.3 AC supply specification

The drive is suitable for use in a circuit capable of delivering not more than 100,000rms symmetrical Amperes at 264Vac rms maximum (200V drives), 528Vac rms maximum (400V drives) or 600Vac rms maximum (575V and 690V drives).

### 14.4 Maximum continuous output current

The drive models are listed as having the maximum continuous output currents (FLC) shown in Table 14-1, Table 14-2, Table 14-3 and Table 14-4 (see Chapter 12 *Technical Data* on page 258 for details).

Table 14-1 Maximum continuous output current (200V drives)

| Model | FLC (A) | Model | FLC (A) |
|-------|---------|-------|---------|
| 0201  | 2.2     | 2201  | 15.5    |
| 0202  | 3.1     | 2202  | 22      |

#### 14.5 Safety label

The safety label supplied with the connectors and mounting brackets must be placed on a fixed part inside the drive enclosure where it can be seen clearly by maintenance personnel for UL compliance.

The label clearly states "CAUTION Risk of Electric Shock Power down unit 10 minutes before removing cover".
